Welcome

This is the Amazon Elastic Compute Cloud API Reference. It provides descriptions, syntax, and usage examples for each of the actions and data types for Amazon EC2.

Note
This guide also includes the actions for Amazon Virtual Private Cloud (Amazon VPC). For more information about this service, go to the Amazon Virtual Private Cloud User Guide.

This reference has a single set of topics that you can reference for both the Query and SOAP APIs (the actions are the same for both APIs). The topic for each action shows the Query API request parameters and the XML response (which is the same for both APIs). The XML request elements for the SOAP API have names that are similar to the Query API parameter names. You can view the XML request elements in the WSDL, or look at the proxy classes that a SOAP toolkit generates from the WSDL.

AllocateAddress

Description

Acquires an Elastic IP address for use with your instances.

This action applies to both EC2 and VPC Elastic IP addresses. For information about how these Elastic IP addresses differ, see Elastic IP Addresses in the Amazon Virtual Private Cloud User Guide.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Domain</td>
<td>Set to vpc to allocate the address for use with instances in a VPC.</td>
<td>Conditional</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Valid values: vpc</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: Address is allocated for use with EC2 instances</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Condition: Required when allocating an address for use with instances in a VPC</td>
<td></td>
</tr>
</tbody>
</table>

Response Elements

The elements in the following table are wrapped in an AllocateAddressResponse element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request.</td>
</tr>
<tr>
<td></td>
<td>Type: xsd:string</td>
</tr>
<tr>
<td>publicIp</td>
<td>The Elastic IP address.</td>
</tr>
<tr>
<td></td>
<td>Type: xsd:string</td>
</tr>
<tr>
<td>domain</td>
<td>Specifies whether this Elastic IP address is for instances in EC2 (standard) or instances in a VPC.</td>
</tr>
<tr>
<td></td>
<td>Type: xsd:string</td>
</tr>
<tr>
<td></td>
<td>Valid values: standard</td>
</tr>
<tr>
<td>allocationId</td>
<td>The ID that AWS assigns to represent the allocation of the address for use with Amazon VPC. Returned only for VPC elastic IP addresses.</td>
</tr>
<tr>
<td></td>
<td>Type: xsd:string</td>
</tr>
</tbody>
</table>

Examples

Example Request

This example returns an Elastic IP address for use with the account.
Example Response

```
<AllocateAddressResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/"
   <requestId>59dbff89-35bd-4ec-99ed-be587EXAMPLE</requestId>
   <publicIp>192.0.2.1</publicIp>
</AllocateAddressResponse>
```

Example Request

This example returns a VPC Elastic IP address for use with Amazon VPC.

```
https://ec2.amazonaws.com/?Action=AllocateAddress
Domain=vpc
&AUTHPARAMS
```

Example Response

```
<AllocateAddressResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/"
   <requestId>59dbff89-35bd-4ec-99ed-be587EXAMPLE</requestId>
   <publicIp>198.51.100.1</publicIp>
   <domain>vpc</domain>
   <allocationId>eipalloc-5723d13e</allocationId>
</AllocateAddressResponse>
```

AssignPrivateIpAddresses

Description

Assigns one or more secondary private IP addresses to a network interface in Amazon VPC. You can specify one or more specific secondary IP addresses that you want to assign, or you can specify a number of secondary IP addresses to be automatically assigned within the subnet’s CIDR block range. The number of secondary IP addresses that you can assign to an instance varies by instance type. For information on Amazon EC2 instance types, see Available Instance Types in the Amazon Elastic Compute Cloud User Guide. For more information about Elastic IP addresses for Amazon VPC, see Elastic IP Addresses in the Amazon Virtual Private Cloud User Guide.

This action is available only in Amazon VPC.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>NetworkInterfaceId</td>
<td>The network interface to which the IP address is assigned. Type: String Default: None</td>
<td>Yes</td>
</tr>
<tr>
<td>PrivateIpAddress.n</td>
<td>The IP address to be assigned as a secondary private IP address to the network interface. This option can be used multiple times to assign multiple secondary private IP addresses to the network interface. Type: AssignPrivateIpAddressesSetItemRequestType Default: None Condition: You cannot specify this parameter when also specifying SecondaryPrivateIpAddressCount.</td>
<td>Conditional</td>
</tr>
<tr>
<td>SecondaryPrivateIpAddressCount</td>
<td>The number of secondary IP addresses to assign to the network interface. Type: Integer Default: None Condition: You cannot specify this parameter when also specifying PrivateIpAddress.n.</td>
<td>Conditional</td>
</tr>
<tr>
<td>AllowReassignment</td>
<td>Specifies whether to allow an IP address that is already assigned to another network interface or instance to be reassigned to the specified network interface. Type: Boolean Default: False</td>
<td>No</td>
</tr>
</tbody>
</table>

Response Elements

The elements in the following table are wrapped in an AssignPrivateIpAddressesResponse element.
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request.</td>
</tr>
<tr>
<td></td>
<td>Type: xsd:string</td>
</tr>
<tr>
<td>return</td>
<td>Returns true if the request succeeds. Otherwise, returns an error.</td>
</tr>
<tr>
<td></td>
<td>Type: xsd:boolean</td>
</tr>
</tbody>
</table>

## Examples

### Example Request

This example assigns two secondary private IP addresses (10.0.2.1 and 10.0.2.11) to the specified network interface.

https://ec2.amazonaws.com/?Action=AssignPrivateIpAddresses
&NetworkInterfaceId=eni-d83388b1
&PrivateIpAddress.0=10.0.2.1
&PrivateIpAddress.1=10.0.2.11
&AUTHPARAMS

### Example Response

```xml
<AssignPrivateIpAddresses xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <return>true</return>
</AssignPrivateIpAddresses>
```

### Example Request

This example assigns two secondary private IP addresses to the network interface. The IP addresses are automatically assigned from the available IP addresses within the subnet's CIDR block range.

https://ec2.amazonaws.com/?Action=AssignPrivateIpAddresses
&NetworkInterfaceId=eni-d83388b1
&SecondaryPrivateIpAddressCount=2
&AUTHPARAMS

### Example Response

```xml
<AssignPrivateIpAddresses xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <return>true</return>
</AssignPrivateIpAddresses>
```

## Related Operations

- [DescribeAddresses](p. 161)
- [ReleaseAddress](p. 380)
• AssociateAddress (p. 18)
• DisassociateAddress (p. 336)
AssociateAddress

Description

Associates an Elastic IP address with an instance.

This action applies to both EC2 and VPC Elastic IP addresses. For information about how these Elastic IP addresses differ, see Elastic IP Addresses in the Amazon Virtual Private Cloud User Guide.

EC2: If the IP address is currently assigned to another instance, the IP address is assigned to the new instance. For more information about EC2 Elastic IP addresses, see Instance Addressing in the Amazon Elastic Compute Cloud User Guide.

VPC: If the IP address is currently assigned to another instance, Amazon EC2 returns an error unless you specify the AllowReassociation parameter.

This is an idempotent operation. If you enter it more than once, Amazon EC2 does not return an error.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>PublicIp</td>
<td>The Elastic IP address to assign to the instance.</td>
<td>Conditional</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Condition: Required for EC2 Elastic IP addresses.</td>
<td></td>
</tr>
<tr>
<td>InstanceId</td>
<td>The instance to associate with the IP address.</td>
<td>Conditional</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td>AllocationId</td>
<td>The allocation ID that AWS returned when you allocated the Elastic IP address for use with Amazon VPC.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Condition: Required for VPC Elastic IP addresses.</td>
<td></td>
</tr>
<tr>
<td>NetworkInterfaceId</td>
<td>The network interface ID to associate with an instance.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Association fails when specifying an instance ID unless exactly one interface is attached.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Condition: If the instance has more than one network interface, you must specify a network interface ID. Available for VPC Elastic IP addresses only.</td>
<td></td>
</tr>
<tr>
<td>PrivateIpAddress</td>
<td>The primary or secondary private IP address to associate with the Elastic IP address. If no private IP address is specified, the Elastic IP address is associated with the primary private IP address. Available for VPC Elastic IP addresses only.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
</tbody>
</table>
Required Description

Name: AllowReassociation
Description: Allows an Elastic IP address that is already associated with another network interface or instance to be re-associated with the specified instance or interface. If the Elastic IP address is associated, and this option is not specified, the operation fails. Available for VPC Elastic IP addresses only.
Type: Boolean
Default: false if not specified
Required: No

Response Elements

The elements in the following table are wrapped in an AssociateAddressResponse element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request. Type: xsd:string</td>
</tr>
<tr>
<td>return</td>
<td>Returns true if the request succeeds. Otherwise, returns an error. Type: xsd:boolean</td>
</tr>
<tr>
<td>associationId</td>
<td>The ID that AWS provides to represent the association of the address with an instance. Returned only for VPC Elastic IP addresses. Type: xsd:string</td>
</tr>
</tbody>
</table>

Examples

Example Request

This example associates an EC2 Elastic IP address with an instance.

https://ec2.amazonaws.com/?Action=AssociateAddress
&InstanceId=i-2ea64347
&PublicIp=192.0.2.1
&AUTHPARAMS

Example Response

<AssociateAddressResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <return>true</return>
</AssociateAddressResponse>

Example Request

This example associates a VPC Elastic IP address with an instance in your VPC and allows the Elastic IP address to be re-assigned to this instance if it is currently assigned to another instance or interface.
Example Response

```xml
<AssociateAddressResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <return>true</return>

AssociateDhcpOptions

Description

Associates a set of DHCP options (that you've previously created) with the specified VPC. Or, associates no DHCP options with the VPC.

After you associate the options with the VPC, any existing instances and all new instances that you launch in that VPC use the options. You don't need to restart or relaunch the instances. They automatically pick up the changes within a few hours, depending on how frequently the instance renews its DHCP lease. If you want, you can explicitly renew the lease using the operating system on the instance.

For more information about the supported DHCP options and using them with Amazon VPC, see Using DHCP Options in Your VPC in the Amazon Virtual Private Cloud User Guide.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>DhcpOptionsId</td>
<td>The ID of the DHCP options you want to associate with the VPC, or default if you want the VPC to use no DHCP options.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td>VpcId</td>
<td>The ID of the VPC you want to associate the DHCP options with.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
</tbody>
</table>

Response Elements

The elements in the following table are wrapped in an AssociateDhcpOptionsResponse element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request.</td>
</tr>
<tr>
<td></td>
<td>Type: xsd:string</td>
</tr>
<tr>
<td>return</td>
<td>Returns true if the request succeeds. Otherwise, returns an error.</td>
</tr>
<tr>
<td></td>
<td>Type: xsd:boolean</td>
</tr>
</tbody>
</table>

Examples

Example Request

This example associates the DHCP options with ID dopt-7a8b9c2d with the VPC with ID vpc-1a2b3c4d.
Example Response

```xml
<AssociateDhcpOptionsResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
  <requestId>7a62c49f-347e-4fc4-9331-6e8eEXAMPLE</requestId>
  <return>true</return>
</AssociateDhcpOptionsResponse>
```

Example Request

This example changes the VPC with ID vpc-1a2b3c4d to use no DHCP options.

```sql
https://ec2.amazonaws.com/?Action=AssociateDhcpOptions
&DhcpOptionsId=default
&VpcId=vpc-1a2b3c4d
&AUTHPARAMS
```

Example Response

```xml
<AssociateDhcpOptionsResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
  <requestId>7a62c49f-347e-4fc4-9331-6e8eEXAMPLE</requestId>
  <return>true</return>
</AssociateDhcpOptionsResponse>
```

AssociateRouteTable

Description

Associates a subnet with a route table. The subnet and route table must be in the same VPC. This association causes traffic originating from the subnet to be routed according to the routes in the route table. The action returns an association ID, which you need if you want to disassociate the route table from the subnet later. A route table can be associated with multiple subnets.

For more information about route tables, see Route Tables in the Amazon Virtual Private Cloud User Guide.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>RouteTableId</td>
<td>The ID of the route table.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td>SubnetId</td>
<td>The ID of the subnet.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
</tbody>
</table>

Response Elements

The elements in the following table are wrapped in an AssociateRouteTableResponse element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request.</td>
</tr>
<tr>
<td></td>
<td>Type: xsd:string</td>
</tr>
<tr>
<td>associationId</td>
<td>The ID that AWS provides to represent the association of the route table and subnet.</td>
</tr>
<tr>
<td></td>
<td>Type: xsd:string</td>
</tr>
<tr>
<td></td>
<td>Example: rtbassoc-f8ad4891</td>
</tr>
</tbody>
</table>

Examples

Example Request

This example associates a route table with ID rtb-e4ad488d with a subnet with ID subnet-15ad487c.

https://ec2.amazonaws.com/?Action=AssociateRouteTable
&RouteTableId=rtb-e4ad488d
&SubnetId=subnet-15ad487c
Example Response

```xml
<AssociateRouteTableResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <associationId>rtbassoc-f8ad4891</associationId>
</AssociateRouteTableResponse>
```

AttachInternetGateway

Description

Attaches an Internet gateway to a VPC, enabling connectivity between the Internet and the VPC. For more information about your VPC and Internet gateway, see the Amazon Virtual Private Cloud User Guide.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>InternetGatewayId</td>
<td>The ID of the Internet gateway.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td>VpcId</td>
<td>The ID of the VPC.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
</tbody>
</table>

Response Elements

The elements in the following table are wrapped in an AttachInternetGatewayResponse element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request. Type: xsd:string</td>
</tr>
<tr>
<td>return</td>
<td>Returns true if the request succeeds. Otherwise, returns an error. Type: xsd:boolean</td>
</tr>
</tbody>
</table>

Examples

Example Request

The example attaches the Internet gateway with ID igw-eaad4883 to the VPC with ID vpc-11ad4878.

https://ec2.amazonaws.com/?Action=AttachInternetGateway
&InternetGatewayId=igw-eaad4883
&VpcId=vpc-11ad4878
&AUTHPARAMS

Example Response

<AttachInternetGatewayResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/"
<requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
<return>true</return>

AttachNetworkInterface

Description

Attaches a network interface to an instance.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>NetworkInterfaceId</td>
<td>The ID of the network interface to attach. Type: String Default: None</td>
<td>Yes</td>
</tr>
<tr>
<td>InstanceId</td>
<td>The ID of the instance to attach to the network interface. Type: String Default: None</td>
<td>Yes</td>
</tr>
<tr>
<td>DeviceIndex</td>
<td>The index of the device for the network interface attachment. Type: Integer Default: None</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Response Elements

The elements in the following table are wrapped in an AttachNetworkInterfaceResponse element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the attachment request. Type: xsd:string</td>
</tr>
<tr>
<td>attachmentId</td>
<td>The ID of the attachment. Type: xsd:string</td>
</tr>
</tbody>
</table>

Examples

Example Request

This example attaches an elastic network interface (ENI) eni-ffda3197 to the specified instance i-9cc316fe.

https://ec2.amazonaws.com/?Action=AttachNetworkInterface &DeviceIndex=1 &InstanceId=i-9cc316fe &NetworkInterfaceId=eni-ffda3197 &AUTHPARAMS
Example Response

```xml
  <requestId>ace8cd1e-e685-4e44-90fb-92014d907212</requestId>
  <attachmentId>eni-attach-d94b09b0</attachmentId>
</AttachNetworkInterfaceResponse>
```

AttachVolume

Description

Attaches an Amazon EBS volume to a running instance and exposes it to the instance with the specified device name.

For a list of supported device names, see Attaching the Volume to an Instance. Any device names that aren't reserved for instance store volumes can be used for Amazon EBS volumes. For more information, see Amazon EC2 Instance Store.

Note

If a volume has an AWS Marketplace product code:

- The volume can only be attached to the root device of a stopped instance.
- You must be subscribed to the AWS Marketplace code that is on the volume.
- The configuration (instance type, operating system) of the instance must support that specific AWS Marketplace code. For example, you cannot take a volume from a Windows instance and attach it to a Linux instance.
- AWS Marketplace product codes are copied from the volume to the instance.

For an overview of the AWS Marketplace, go to https://aws.amazon.com/marketplace/help/200900000. For details on how to use the AWS Marketplace, see AWS Marketplace.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>VolumeId</td>
<td>The ID of the Amazon EBS volume. The volume and instance must be within the same Availability Zone. Type: String Default: None</td>
<td>Yes</td>
</tr>
<tr>
<td>InstanceId</td>
<td>The ID of the instance. The instance must be running. Type: String Default: None</td>
<td>Yes</td>
</tr>
<tr>
<td>Device</td>
<td>The device name as exposed to the instance (e.g., /dev/sdh, or xvdh). Type: String Default: None</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Response Elements

The elements in the following table are wrapped in an AttachVolumeResponse element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request. Type: xsd:string</td>
</tr>

AuthorizeSecurityGroupEgress

Description

Adds one or more egress rules to a VPC security group. Specifically, this action permits instances in a security group to send traffic to one or more destination CIDR IP address ranges, or to one or more destination security groups in the same VPC.

This action applies only to security groups in a VPC; it’s not supported for EC2 security groups. For information about Amazon Virtual Private Cloud and VPC security groups, see Security Groups in the Amazon Virtual Private Cloud User Guide.

Each rule consists of the protocol (e.g., TCP), plus either a CIDR range or a source group. For the TCP and UDP protocols, you must also specify the destination port or port range. For the ICMP protocol, you must also specify the ICMP type and code. You can use -1 for the type or code to mean all types or all codes.

Rule changes are propagated to instances within the security group as quickly as possible. However, a small delay might occur.

Important

For VPC security groups: You can have up to 50 rules total per group (covering both ingress and egress).

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>GroupId</td>
<td>The ID of the VPC security group to modify. Type: String Default: None</td>
<td>Yes</td>
</tr>
<tr>
<td>IpPermissions.n.IpPermissions.n.IpPermission.n.IpProtocol</td>
<td>The IP protocol name or number (go to Protocol Numbers). When you call DescribeSecurityGroups, the protocol value returned is the number. Exception: For TCP, UDP, and ICMP, the value returned is the name (for example, tcp, udp, or icmp). Type: String Valid values: tcp</td>
<td>Yes</td>
</tr>
<tr>
<td>IpPermissions.n.IpPermissions.n.IpPermission.n.From Port</td>
<td>The start of port range for the TCP and UDP protocols, or an ICMP type number. For the ICMP type number, you can use -1 to specify all ICMP types. Type: Integer Default: None Condition: Required for ICMP and any protocol that uses ports</td>
<td>Conditional</td>
</tr>
</tbody>
</table>
Response Elements

The elements in the following table are wrapped in an `AuthorizeSecurityGroupEgressResponse` element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>IpPermissions.n.ToPort</td>
<td>The end of port range for the TCP and UDP protocols, or an ICMP code number. For the ICMP code number, you can use -1 to specify all ICMP codes for the given ICMP type. Type: Integer Default: None Condition: Required for ICMP and any protocol that uses ports.</td>
<td>Conditional</td>
</tr>
<tr>
<td>IpPermissions.n.Groups.m.GroupId</td>
<td>The name of the destination security group. Cannot be used when specifying a CIDR IP address. Type: String Default: None Condition: Required if modifying access for one or more destination security groups.</td>
<td>Conditional</td>
</tr>
<tr>
<td>IpPermissions.n.IpRanges.m.CidrIp</td>
<td>The CIDR range. Cannot be used when specifying a destination security group. Type: String Default: None Constraints: Valid CIDR IP address range. Condition: Required if modifying access for one or more IP address ranges.</td>
<td>Conditional</td>
</tr>
</tbody>
</table>

Examples

Example Request

This example grants your VPC security group with ID sg-1a2b3c4d access to the 192.0.2.0/24 and 198.51.100.0/24 address ranges on TCP port 80.

https://ec2.amazonaws.com/?Action=AuthorizeSecurityGroupEgress &GroupId=sg-1a2b3c4d &IpPermissions.1.IpProtocol=tcp &IpPermissions.1.FromPort=80
Example Request

This example grants your VPC security group with ID sg-1a2b3c4d access to your VPC security group with ID sg-9a8d7f5c on TCP port 1433.

```
&GroupId=sg-1a2b3c4d
&IpPermissions.1.IpProtocol=tcp
&IpPermissions.1.FromPort=1433
&IpPermissions.1.ToPort=1433
&IpPermissions.1.Groups.1.GroupId=sg-9a8d7f5c
```

Example Response

```
<AuthorizeSecurityGroupEgressResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>

AuthorizeSecurityGroupIngress

Description

Adds one or more ingress rules to a security group. This action applies to both EC2 security groups and VPC security groups. For information about VPC security groups and how they differ from EC2 security groups, see Security Groups in the Amazon Virtual Private Cloud User Guide.

For EC2 security groups, this action gives one or more CIDR IP address ranges permission to access a security group in your account, or gives one or more security groups (called the source groups) permission to access a security group in your account. A source group can be in your own AWS account, or another.

For VPC security groups, this action gives one or more CIDR IP address ranges permission to access a security group in your VPC, or gives one or more other security groups (called the source groups) permission to access a security group in your VPC. The groups must all be in the same VPC.

Each rule consists of the protocol (e.g., TCP), plus either a CIDR range or a source group. For the TCP and UDP protocols, you must also specify the destination port or port range. For the ICMP protocol, you must also specify the ICMP type and code. You can use -1 for the type or code to mean all types or all codes.

Rule changes are propagated to instances within the security group as quickly as possible. However, a small delay might occur.

Important
For EC2 security groups: You can have up to 100 rules per group.
For VPC security groups: You can have up to 50 rules total per group (covering both ingress and egress).

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>

<td>Conditional</td>
</tr>
</tbody>
</table>

Examples

Example Request

This example is for an EC2 security group. The request grants the 192.0.2.0/24 and 198.51.100.0/24 address ranges access to your \textit{websrv} security group on TCP port 80.

\begin{verbatim}
https://ec2.amazonaws.com/?Action=AuthorizeSecurityGroupIngress &GroupName=websrv &IpPermissions.1.IpProtocol=tcp &IpPermissions.1.FromPort=80 &IpPermissions.1.ToPort=80 &IpPermissions.1.IpRanges.1.CidrIp=192.0.2.0/24 &IpPermissions.1.IpRanges.2.CidrIp=198.51.100.0/24 &AUTHPARAMS
\end{verbatim}

Example Request

This example is for an EC2 security group. The request grants TCP port 80 access from the source group called \textit{OtherAccountGroup} (in AWS account 111122223333) to your \textit{websrv} security group.
Example Request

This example is for a VPC security group. The request grants TCP port 80 access from the source group called *OtherGroupInMyVPC* (sg-0a5d8e02) to your *VpcWebServers* security group (sg-140ba4c8). The request requires the group IDs and not the group names. Your AWS account ID is 111122223333.

Example Response

```xml
<AuthorizeSecurityGroupIngressResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <return>true</return>
</AuthorizeSecurityGroupIngressResponse>
```

**BundleInstance**

**Description**

Bundles an Amazon instance store-backed Windows instance.

During bundling, only the root device volume (C:) is bundled. Data on other instance store volumes is not preserved.

**Note**

This procedure is not applicable for Linux/UNIX instances or Windows instances that are backed by Amazon EBS.

**Request Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>InstanceId</td>
<td>The ID of the instance to bundle. Type: String</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td>Storage.S3.Bucket</td>
<td>The bucket in which to store the AMI. You can specify a bucket that you already own or a new bucket that Amazon EC2 creates on your behalf. If you specify a bucket that belongs to someone else, Amazon EC2 returns an error. Type: String Default: None</td>
<td>Yes</td>
</tr>
<tr>
<td>Storage.S3.Prefix</td>
<td>The beginning of the file name of the AMI. Type: String Default: None</td>
<td>Yes</td>
</tr>
<tr>
<td>Storage.S3.AWSAccessKeyId</td>
<td>The Access Key ID of the owner of the Amazon S3 bucket. Type: String Default: None</td>
<td>Yes</td>
</tr>
<tr>
<td>Storage.S3.UploadPolicy</td>
<td>A Base64-encoded Amazon S3 upload policy that gives Amazon EC2 permission to upload items into Amazon S3 on your behalf. Type: String Default: None</td>
<td>Yes</td>
</tr>
<tr>
<td>Storage.S3.UploadPolicySignature</td>
<td>The signature of the Base64 encoded JSON document. Type: String Default: None</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**JSON Parameters**

The upload policy gives Amazon EC2 limited permission to upload items into your Amazon S3 bucket. The following table describes the required parameters for the upload policy JSON document. Parameter names are case sensitive. For more information about upload policies and how to sign them, see the...
sections about policy construction and signatures in the Amazon Simple Storage Service Developer Guide.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>expiration</td>
<td>The expiration of the policy. We recommend 12 hours or longer.</td>
<td>Yes</td>
</tr>
<tr>
<td>conditions</td>
<td>A list of restrictions on what can be uploaded to Amazon S3. Must contain the bucket and ACL conditions in this table.</td>
<td>Yes</td>
</tr>
<tr>
<td>bucket</td>
<td>The bucket to store the AMI.</td>
<td>Yes</td>
</tr>
<tr>
<td>acl</td>
<td>This must be set to ec2-bundle-read.</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Response Elements

The elements in the following table are wrapped in a BundleInstanceResponse element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request.</td>
</tr>
<tr>
<td>bundleInstanceTask</td>
<td>The bundle task.</td>
</tr>
</tbody>
</table>

Examples

Example Request

This example bundles the i-e468cd8d instance.

```
https://ec2.amazonaws.com/?Action=BundleInstance
&InstanceId=i-e468cd8d
&Storage.S3.AWSAccessKeyId='AKIAIOSFODNN7EXAMPLE'
&Storage.S3.Bucket=myawsbucket
&Storage.S3.Prefix=winami
&Storage.S3.UploadPolicy=eyJleHBpcmF0aW9uIjogIjIwMDgtMDgtMzBUMDg6NDk6MDlaIiwgIiRr
&Storage.S3.UploadPolicySignature=fh5tyyyQD8W4COEthj3nlGNEXAMPLE
&AUTHPARAMS
```

Example Response

```
<BundleInstanceResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <bundleInstanceTask>
    <instanceId>i-12345678</instanceId>
</BundleInstanceResponse>
```

CancelBundleTask

Description
Cancels a bundling operation for an instance store-backed Windows instance.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
</table>
| BundleId  | The ID of the bundle task. Type: String
                                         | Yes      
                                         | Default: None |

Response Elements

The elements in the following table are wrapped in a CancelBundleTaskResponse element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request. Type: xsd:string</td>
</tr>
<tr>
<td>bundleInstanceTask</td>
<td>The bundle task. Type: BundleInstanceTaskType (p. 447)</td>
</tr>
</tbody>
</table>

Examples

Example Request
This example cancels the bun-cla322b9 bundle task.

https://ec2.amazonaws.com/?Action=CancelBundleTask
&BundleId=bun-cla322b9
&AUTHPARAMS

Example Response

```xml
<CancelBundleTaskResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>

CancelConversionTask

Description

Cancels an active conversion task. The task can be the import of an instance or volume. The action removes all artifacts of the conversion, including a partially uploaded volume or instance. If the conversion is complete or is in the process of transferring the final disk image, the command fails and returns an exception.

For more information, see Using the Command Line Tools to Import Your Virtual Machine to Amazon EC2 in the Amazon Elastic Compute Cloud User Guide.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>ConversionTaskId</td>
<td>The ID of the task.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
</tbody>
</table>

Response Elements

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request. Type: string</td>
</tr>
<tr>
<td>return</td>
<td>Indicates whether the cancellation was successful. Type: Boolean</td>
</tr>
</tbody>
</table>

Examples

Example Request

This example cancels the conversion task with ID import-i-fh95npoc.

https://ec2.amazonaws.com/?Action=CancelConversionTask&ConversionTaskId=import-i-fh95npoc

Example Response

<CancelConversionTaskResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/"
    requestId=59dbff89-35bd-4eac-99ed-be587EXAMPLE>
    <return>true</return>
</CancelConversionTaskResponse>

CancelSpotInstanceRequests

Description

Cancels one or more Spot Instance requests. Spot Instances are instances that Amazon EC2 starts on your behalf when the maximum price that you specify exceeds the current Spot Price. Amazon EC2 periodically sets the Spot Price based on available Spot Instance capacity and current Spot Instance requests. For more information about Spot Instances, see Spot Instances in the Amazon Elastic Compute Cloud User Guide.

Important
Canceling a Spot Instance request does not terminate running Spot Instances associated with the request.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>SpotInstanceRequestId.&lt;n&gt;</td>
<td>One or more Spot Instance request IDs. Type: String Default: None</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Response Elements

The elements in the following table are wrapped in a CancelSpotInstanceRequestsResponse element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request. Type: xsd:string</td>
</tr>
<tr>
<td>spotInstanceRequestSet</td>
<td>A list of Spot Instance requests. Each request is wrapped in an item element. Type: CancelSpotInstanceRequestsResponseSetItemType (p. 448)</td>
</tr>
</tbody>
</table>

Examples

Example Request

This example cancels a Spot Instance request.

https://ec2.amazonaws.com/?Action=CancelSpotInstanceRequests &SpotInstanceRequestId.1=sir-e95fae02 &AUTHPARAMS
Example Response

```xml
<CancelSpotInstanceRequestsResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">

ConfirmProductInstance

Description

Determines whether a product code is associated with an instance. This action can only be used by the owner of the product code. It is useful when a product code owner needs to verify whether another EC2 user's instance is eligible for support.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>ProductCode</td>
<td>The product code.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td>InstanceId</td>
<td>The instance.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
</tbody>
</table>

Response Elements

The elements in the following table are wrapped in a `ConfirmProductInstanceResponse` element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request. Type: xsd:string</td>
</tr>
<tr>
<td>return</td>
<td>Returns <code>true</code> if the product code is attached to the instance. Otherwise, returns an error. Type: xsd:boolean</td>
</tr>
<tr>
<td>ownerId</td>
<td>The instance owner's account ID. Only present if the product code is attached to the instance. Type: xsd:string</td>
</tr>
</tbody>
</table>

Examples

Example Request

This example displays the product code that is associated with the instance.

https://ec2.amazonaws.com/?Action=ConfirmProductInstance
&ProductCode=774F4FF8
&InstanceId=i-10a64379
&AUTHPARAMS
Example Response

```xml
<ConfirmProductInstanceResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <return>true</return>
  <ownerId>111122223333</ownerId>
</ConfirmProductInstanceResponse>
```

CreateCustomerGateway

Description

Provides information to AWS about your VPN customer gateway device. The customer gateway is the appliance at your end of the VPN connection. (The device on the AWS side of the VPN connection is the virtual private gateway.) You must provide the Internet-routable IP address of the customer gateway's external interface. The IP address must be static and can't be behind a device performing network address translation (NAT).

You must provide the Internet-routable IP address of the customer gateway's external interface. The IP address must be static and can't be behind a device performing network address translation (NAT).

For devices that use Border Gateway Protocol (BGP), you can also provide the device's BGP Autonomous System Number (ASN). You can use an existing ASN assigned to your network. If you don't have an ASN already, you can use a private ASN (in the 64512 - 65534 range).

Note

Amazon EC2 supports all 2-byte ASN numbers in the range of 1 - 65534, with the exception of 7224, which is reserved in the US East Region, and 9059, which is reserved in the EU West Region.

For more information about ASNs, see the Wikipedia article.

For more information about Amazon Virtual Private Cloud and VPN customer gateways, see Adding an IPsec Hardware Virtual Private Gateway to Your VPC in the Amazon Virtual Private Cloud User Guide.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>The type of VPN connection this customer gateway supports.</td>
<td>Yes</td>
</tr>

<td></td>
</tr>
<tr>
<td></td>
<td>Valid values: ipsec.1</td>
<td></td>
</tr>
<tr>
<td>IpAddress</td>
<td>The Internet-routable IP address for the customer gateway's outside interface. The address must be static.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td>BgpAsn</td>
<td>The customer gateway's Border Gateway Protocol (BGP) Autonomous System Number (ASN) for devices that support BGP.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: Integer</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: 65000</td>
<td></td>
</tr>
</tbody>
</table>

Response Elements

The elements in the following table are wrapped in an CreateCustomerGatewayResponse element.
### Examples

#### Example Request

This example passes information to AWS about the VPN customer gateway with IP address 12.1.2.3 and BGP ASN 65534.

```
https://ec2.amazonaws.com/?Action=CreateCustomerGateway
&Type=ipsec.1
&IpAddress=12.1.2.3
&BgpAsn=65534
&AUTHPARAMS
```

#### Example Response

```
<CreateCustomerGatewayResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
  <requestId>7a62c49f-347e-4fc4-9331-6e8eEXAMPLE</requestId>
  <customerGateway>
    <customerGatewayId>cgw-b4dc3961</customerGatewayId>
    <state>pending</state>
    <type>ipsec.1</type>
    <ipAddress>12.1.2.3</ipAddress>
    <bgpAsn>65534</bgpAsn>
    <tagSet/>
  </customerGateway>
</CreateCustomerGatewayResponse>
```

#### Related Operations

- [DescribeCustomerGateways](p. 174)
- [DeleteCustomerGateway](p. 119)
CreateDhcpOptions

Description

Creates a set of DHCP options for your VPC. After creating the new set, you must associate it with the VPC, causing all existing and new instances that you launch in the VPC to use the new set of DHCP options. The following table lists the individual DHCP options you can specify. For more information about the options, see RFC 2132.

<table>
<thead>
<tr>
<th>DHCP Option Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>domain-name</td>
<td>A domain name of your choice (for example, example.com).</td>
</tr>
<tr>
<td>domain-name-servers</td>
<td>The IP address of a domain name server. You can specify up to four addresses.</td>
</tr>
<tr>
<td>ntp-servers</td>
<td>The IP address of a Network Time Protocol (NTP) server. You can specify up to four addresses.</td>
</tr>
<tr>
<td>netbios-name-servers</td>
<td>The IP address of a NetBIOS name server. You can specify up to four addresses.</td>
</tr>
<tr>
<td>netbios-node-type</td>
<td>The NetBIOS node type (1, 2, 4, or 8). For more information about the values, see RFC 2132. We recommend you only use 2 at this time (broadcast and multicast are currently not supported).</td>
</tr>
</tbody>
</table>

Important

Your VPC automatically starts out with a set of DHCP options that includes only a DNS server that we provide (AmazonProvidedDNS). If you create a new set of options, and if your VPC has an Internet gateway, make sure to set the domain-name-servers option either to AmazonProvidedDNS or to a domain name server of your choice.

For more information about Amazon Virtual Private Cloud and DHCP options, see Using DHCP Options in Your VPC in the Amazon Virtual Private Cloud User Guide.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>DhcpConfiguration.n.Key</td>
<td>The name of a DHCP option. Type: String Default: None</td>
<td>Yes</td>
</tr>
<tr>
<td>DhcpConfiguration.n.Value.m</td>
<td>A value for the DHCP option. Type: String Default: None</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Response Elements

The elements in the following table are wrapped in an CreateDhcpOptionsResponse element.
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request.</td>
</tr>
<tr>
<td></td>
<td>Type: xsd:string</td>
</tr>
<tr>
<td>dhcpOptions</td>
<td>A set of DHCP options.</td>
</tr>
<tr>
<td></td>
<td>Type: DhcpOptionsType (p. 462)</td>
</tr>
</tbody>
</table>

## Examples

### Example Request

This example creates a new set of DHCP options with a domain name example.com and two DNS servers (10.2.5.1 and 10.2.5.2).

```xml
https://ec2.amazonaws.com/?Action=CreateDhcpOptions
&DhcpConfiguration.1.Key=domain-name
&DhcpConfiguration.1.Value.1=example.com
&DhcpConfiguration.2.Key=domain-name-servers
&DhcpConfiguration.2.Value.1=10.2.5.1
&DhcpConfiguration.2.Value.2=10.2.5.2
&AUTHPARAMS
```

### Example Response

```xml
<CreateDhcpOptionsResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
  <requestId>7a62c49f-347e-4fc4-9331-6e8eEXAMPLE</requestId>
  <dhcpOptions>
    <dhcppOptionsId>dopt-7a8b9c2d</dhcppOptionsId>
    <dhcppConfigurationSet>
      <item>
        <key>domain-name</key>
        <valueSet>
          <item>
            <value>example.com</value>
          </item>
        </valueSet>
      </item>
      <item>
        <key>domain-name-servers</key>
        <valueSet>
          <item>
            <value>10.2.5.1</value>
          </item>
          <item>
            <value>10.2.5.2</value>
          </item>
        </valueSet>
      </item>
    </dhcppConfigurationSet>
    <tagSet/>
  </dhcpOptions>
</CreateDhcpOptionsResponse>
```
Related Operations

CreateImage

Description

Creates an Amazon EBS-backed AMI from an Amazon EBS-backed instance that is either running or stopped. For more information about Amazon EBS-backed AMIs, see Storage for the Root Device.

Note

If you customized your instance with instance store volumes or EBS volumes in addition to the root device volume, the new AMI contains block device mapping information for those volumes. When you launch an instance from this new AMI, the instance automatically launches with those additional volumes.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>InstanceId</td>
<td>The ID of the instance. Type: String Default: None</td>
<td>Yes</td>
</tr>
<tr>
<td>Name</td>
<td>A name for the new image. Type: String Default: None</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Constraints: 3-128 alphanumeric characters, parenthesis ((())), commas (,), slashes (/), dashes (-), or underscores(_)</td>
<td></td>
</tr>
<tr>
<td>Description</td>
<td>A description of the new image. Type: String Default: None</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Constraints: Up to 255 characters</td>
<td></td>
</tr>
<tr>
<td>NoReboot</td>
<td>By default this parameter is set to false, which means Amazon EC2 attempts to cleanly shut down the instance before image creation and reboots the instance afterwards. When the parameter is set to true, Amazon EC2 does not shut down the instance before creating the image. When this option is used, file system integrity on the created image cannot be guaranteed. Type: Boolean Default: false</td>
<td>No</td>
</tr>
<tr>
<td>BlockDeviceMapping.n.DeviceName</td>
<td>The device name exposed to the instance (for example, /dev/sdh or xvdh). For more information, see Block Device Mapping. Type: String Default: None</td>
<td>Conditional</td>
</tr>
<tr>
<td></td>
<td>Condition: If you're registering an Amazon EBS-backed AMI from a snapshot, you must specify DeviceName with the root device name (for example, /dev/sda1 or xvda), and BlockDeviceMapping.n.Ebs.SnapshotId with the snapshot ID</td>
<td></td>
</tr>
</tbody>
</table>

API Version 2012-10-01

CreateInstanceExportTask

Description

Exports a running or stopped instance to an Amazon S3 bucket. For information about the supported operating systems, image formats, and known limitations for the types of instances you can export, see Exporting EC2 Instances in the Amazon Elastic Compute Cloud User Guide.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>A description of the conversion task or the resource being exported.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td>InstanceId</td>
<td>The ID of the instance being exported.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td>TargetEnvironment</td>
<td>The target virtualization environment.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td>Valid values:</td>

CreateInternetGateway

Description

Creates a new Internet gateway for use with a VPC. After creating the Internet gateway, you attach it to a VPC using AttachInternetGateway (p. 25). For more information about your VPC and Internet gateway, see Amazon Virtual Private Cloud User Guide.

Request Parameters

This action has no request parameters.

Response Elements

The elements in the following table are wrapped in a CreateInternetGatewayResponse element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request.</td>

CreateKeyPair

Description

Creates a new 2048-bit RSA key pair with the specified name. The public key is stored by Amazon EC2 and the private key is returned to you. The private key is returned as an unencrypted PEM encoded PKCS#8 private key. If a key with the specified name already exists, Amazon EC2 returns an error.

Tip

The key pair returned to you works only in the region you’re using when you create the key pair. To create a key pair that works in all regions, use ImportKeyPair (p. 352).

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>KeyName</td>
<td>A unique name for the key pair.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
</tbody>
</table>
|            | Constraints: Accepts alphanumeric characters, spaces, dashes, and underscores. | |}

Response Elements

The elements in the following table are wrapped in a CreateKeyPairResponse element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request.</td>
</tr>
<tr>
<td></td>
<td>Type: xsd:string</td>
</tr>
<tr>
<td>keyName</td>
<td>The key pair name you provided.</td>
</tr>
<tr>
<td></td>
<td>Type: xsd:string</td>
</tr>
<tr>
<td>keyFingerprint</td>
<td>A SHA-1 digest of the DER encoded private key.</td>
</tr>
<tr>
<td></td>
<td>Type: xsd:string</td>
</tr>
<tr>
<td>keyMaterial</td>
<td>An unencrypted PEM encoded RSA private key.</td>
</tr>
<tr>
<td></td>
<td>Type: xsd:string</td>
</tr>
</tbody>
</table>

Examples

Example Request

This example creates a key pair named gsg-keypair.

https://ec2.amazonaws.com/?Action=CreateKeyPair
&KeyName=gsg-keypair
&AUTHPARAMS
Example Response

```xml
<CreateKeyPairResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/"
  requestId="59dbff89-35bd-4eac-99ed-be587EXAMPLE">
  <keyName>gsg-keypair</keyName>
  <keyFingerprint>00:00:00:00:00:00:00:00:00:00:00:00:00:00:00:00:00:00:00:00</keyFingerprint>
  <keyMaterial>---- BEGIN RSA PRIVATE KEY ----
MIICiTCCAfICCQD6m7oRw0uXOjANBgkqhkiG9w0BAQUFADBICBhDDELMAkGA1UEBhMCMV4wEQQMBg0G
----- BEGIN RSA PRIVATE KEY ----
MIICiTCCAfICCQD6m7oRw0uXOjANBgkqhkiG9w0BAQUFADBICBhDDELMAkGA1UEBhMCMV4wEQQMBg0G

CreateNetworkAcl

Description

Creates a network ACL in a VPC. Network ACLs provide an optional layer of security (on top of security groups) for the instances in your VPC. For more information about network ACLs, see Network ACLs in the Amazon Virtual Private Cloud User Guide.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>VpcId</td>
<td>The ID of the VPC. Type: String Default: None</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Response Elements

The elements in the following table are wrapped in a CreateNetworkAclResponse element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request. Type: xsd:string</td>
</tr>
<tr>
<td>networkAcl</td>
<td>Information about the new network ACL. Type: NetworkAclType (p. 496)</td>
</tr>
</tbody>
</table>

Examples

Example Request

The example creates a new network ACL in the VPC with ID vpc-11ad4878. Notice that the response includes a default entry for egress, and another for ingress, each with a very high rule number. These are the last entries Amazon VPC processes to decide whether traffic is allowed in or out of an associated subnet. If the traffic doesn't match any rules with a lower rule number, then these default entries ultimately deny the traffic.

https://ec2.amazonaws.com/?Action=CreateNetworkAcl
&VpcId=vpc-11ad4878
&AUTHPARAMS

Example Response

```xml
<CreateNetworkAclResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <networkAcl>
```

CreateNetworkAclEntry

Description

Creates an entry (a rule) in a network ACL with the specified rule number. Each network ACL has a set of numbered ingress rules and a separate set of numbered egress rules. When determining whether a packet should be allowed in or out of a subnet associated with the ACL, Amazon VPC processes the entries in the ACL according to the rule numbers, in ascending order. Each network ACL has a set of ingress rules and a separate set of egress rules.

Tip
We recommend that you leave room between the rule numbers (for example, 100, 110, 120, etc.), and not number them one right after the other (for example, 101, 102, 103, etc.). This makes it easier to add a new rule between existing ones without having to renumber the rules.

After you add an entry, you can't modify it; you must either replace it, or create a new entry and delete the old one.

For more information about network ACLs, see Network ACLs in the Amazon Virtual Private Cloud User Guide.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>NetworkAclId</td>
<td>The ID of the ACL. Type: String Default: None</td>
<td>Yes</td>
</tr>
<tr>
<td>RuleNumber</td>
<td>The rule number to assign to the entry (for example, 100). ACL entries are processed in ascending order by rule number. Type: Integer Default: None Constraints: Positive integer from 1 to 32766</td>
<td>Yes</td>
</tr>
<tr>
<td>Protocol</td>
<td>The IP protocol the rule applies to. You can use -1 to mean all protocols. Type: Integer Valid values: -1 or a protocol number (go to Protocol Numbers).</td>
<td>Yes</td>
</tr>
<tr>
<td>RuleAction</td>
<td>Indicates whether to allow or deny traffic that matches the rule. Type: String Default: None Valid values: allow</td>
<td>True</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Required</td>
</tr>
<tr>
<td>-------------</td>
<td>------------------------------------------------------------------------------</td>
<td>----------</td>
</tr>
</tbody>
</table>
| Egress      | Indicates whether this rule applies to egress traffic from the subnet (true) or ingress traffic to the subnet (false).  
Type: Boolean  
Default: false  
Valid values: true | No       |
| CidrBlock   | The CIDR range to allow or deny, in CIDR notation (for example, 172.16.0.0/24).  
Type: String  
Default: None | Yes      |
| Icmp.Code   | For the ICMP protocol, the ICMP code. You can use -1 to specify all ICMP codes for the given ICMP type.  
Type: Integer  
Default: None  
Condition: Required if specifying 1 (ICMP) for the protocol. | Conditional |
| Icmp.Type   | For the ICMP protocol, the ICMP type. You can use -1 to specify all ICMP types.  
Type: Integer  
Default: None  
Condition: Required if specifying 1 (ICMP) for the protocol. | Conditional |
| PortRange.From | The first port in the range.  
Type: Integer  
Default: None  
Condition: Required if specifying 6 (TCP) or 17 (UDP) for the protocol. | Conditional |
| PortRange.To  | The last port in the range.  
Type: Integer  
Default: None  
Condition: Required if specifying 6 (TCP) or 17 (UDP) for the protocol. | Conditional |

**Response Elements**

The elements in the following table are wrapped in a CreateNetworkAclEntryResponse element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| requestId | The ID of the request.  
Type: xsd:string                                                                |
| return   | Returns true if the request succeeds. Otherwise, returns an error.  
Type: xsd:boolean                                                               |
Examples

Example Request

This example creates an entry with rule number 110 in the network ACL with ID acl-2cb85d45. The rule allows ingress traffic from anywhere (0.0.0.0/0) on UDP port 53 into any associated subnet.

```
https://ec2.amazonaws.com/?Action=CreateNetworkAclEntry
&NetworkAclId=acl-2cb85d45
&RuleNumber=110
&Protocol=udp
&RuleAction=allow
&Egress=false
&CidrBlock=0.0.0.0/0
&PortRange.From=53
&PortRange.To=53

```

Example Response

```
<CreateNetworkAclEntryResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <return>true</return>
</CreateNetworkAclEntryResponse>
```

# CreateNetworkInterface

## Description

Creates a network interface in the specified subnet.

## Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>SubnetId</td>
<td>The ID of the subnet to associate with the network interface. Type: String</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td>PrivateIpAddress</td>
<td>The primary private IP address of the network interface. Type: String</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td>PrivateIpAddresses.n</td>
<td>The private IP address of the specified network interface. This parameter</td>
<td>No</td>
</tr>
<tr>
<td>.PrivateIpAddress</td>
<td>can be used multiple times to specify explicit private IP addresses for a</td>
<td></td>
</tr>
<tr>
<td></td>
<td>network interface, but only one private IP address can be designated as</td>
<td></td>
</tr>
<tr>
<td></td>
<td>primary. You cannot specify this parameter with the PrivateIpAddresses.n.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Primary value of true if you specify the PrivateIpAddress option. Type:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>String Default: None</td>
<td></td>
</tr>
<tr>
<td>PrivateIpAddresses.n</td>
<td>Specifies whether the private IP address is the primary private IP address.</td>
<td>No</td>
</tr>
<tr>
<td>.Primary</td>
<td>Only one IP address can be designated as primary. You cannot specify this</td>
<td></td>
</tr>
<tr>
<td></td>
<td>parameter with the value of true and the PrivateIpAddresses.n.PrivateIpAddress</td>
<td></td>
</tr>
<tr>
<td></td>
<td>option if you specify the PrivateIpAddress option. Type: Boolean Default:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>False</td>
<td></td>
</tr>
</tbody>
</table>
SecondaryPrivateIpAddressCount

The number of secondary private IP addresses to assign to a network interface. When you specify a number of secondary IP addresses, AWS automatically assigns these IP addresses within the subnet's range.

The number of IP addresses you can assign to a network interface varies by instance type. For more information, see Available Instance Types in the Amazon Elastic Compute Cloud User Guide.

For a single network interface, you cannot specify this option and specify more than one private IP address using `PrivateIpAddress.n`.

Type: Integer
Default: None

No

Description

The description of the network interface.

Type: String
Default: None

No

SecurityGroupId.n

A list of group IDs for use by the network interface.

Type: SecurityGroupIdSetItemType (p. 517)
Default: None

No

Response Elements

The elements in the following table are wrapped in a `CreateNetworkInterfaceResponse` element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request to create a network interface. Type: xsd:string</td>
</tr>
<tr>
<td>networkInterface</td>
<td>The network interface that was created. Type: NetworkInterfaceType (p. 499)</td>
</tr>
</tbody>
</table>

Examples

Example Request

This example creates an elastic network interface (ENI) in the specified subnet with a primary IP address that is automatically assigned to the network interface.

https://ec2.amazonaws.com/?Action=CreateNetworkInterface
&SubnetId=subnet-b2a249da
&AUTHPARAMS
Example Response

```xml
<CreateNetworkInterfaceResponse xmlns='http://ec2.amazonaws.com/doc/2012-10-01/'>
  <requestId>8dbe591e-5a22-48cb-b948-dd0aadd55adf</requestId>
  <networkInterface>
    <networkInterfaceId>eni-cfca76a6</networkInterfaceId>
    <subnetId>subnet-b2a249da</subnetId>
    <vpcId>vpc-c31dafaa</vpcId>
    <availabilityZone>ap-southeast-1b</availabilityZone>
    <description/>
    <ownerId>251839141158</ownerId>
    <requesterManaged>false</requesterManaged>
    <status>pending</status>
    <macAddress>02:74:b0:72:79:61</macAddress>
    <privateIpAddress>10.0.2.157</privateIpAddress>
    <sourceDestCheck>true</sourceDestCheck>
    <groupSet>
      <item>
        <groupId>sg-188d9f74</groupId>
        <groupName>default</groupName>
      </item>
    </groupSet>
    <tagSet/>
    <privateIpAddressesSet>
      <item>
        <privateIpAddress>10.0.2.157</privateIpAddress>
        <primary>true</primary>
      </item>
    </privateIpAddressesSet>
  </networkInterface>
</CreateNetworkInterfaceResponse>
```

Example Request

This example creates an elastic network interface (ENI) in the specified subnet with a primary IP address of 10.0.2.140 and four secondary private IP addresses that are automatically assigned to the network interface.

```
https://ec2.amazonaws.com/?Action=CreateNetworkInterface
&PrivateIpAddresses.0.Primary=true
&PrivateIpAddresses.0.PrivateIpAddress=10.0.2.140
&SecondaryPrivateIpAddressCount=4
&SubnetId=subnet-a61dafcf
&AUTHPARAMS
```

Example Response

```xml
<CreateNetworkInterfaceResponse xmlns='http://ec2.amazonaws.com/doc/2012-10-01/'>
  <requestId>bd78c839-0895-4fac-a17f-98b559b6b630</requestId>
  <networkInterface>
    <networkInterfaceId>eni-1bcb7772</networkInterfaceId>
    <subnetId>subnet-a61dafcf</subnetId>
  </networkInterface>
</CreateNetworkInterfaceResponse>
```
Example Request

The following requests creates a network interface with a primary private IP address of 10.0.2.130 and two secondary IP addresses of 10.0.2.132 and 10.0.2.133.

https://ec2.amazonaws.com/?Action=CreateNetworkInterface
&PrivateIpAddresses.0.Primary=true
&PrivateIpAddresses.0.PrivateIpAddress=10.0.2.130
&PrivateIpAddresses.1.Primary=false
&PrivateIpAddresses.1.PrivateIpAddress=10.0.2.132
&PrivateIpAddresses.2.Primary=false
&PrivateIpAddresses.2.PrivateIpAddress=10.0.2.133
&SubnetId=subnet-a61dafcf
&AUTHPARAMS
Example Response

```xml
<CreateNetworkInterfaceResponse xmlns='http://ec2.amazonaws.com/doc/2012-10-01/'>

CreatePlacementGroup

Description

Creates a placement group that you launch cluster instances into. You must give the group a name unique within the scope of your account. For more information about placement groups and cluster instances, see Using Cluster Instances in the Amazon Elastic Compute Cloud User Guide.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>GroupName</td>
<td>A name for the placement group. Type: String</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td>Strategy</td>
<td>The placement group strategy. Type: String</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Valid values: cluster</td>
<td></td>
</tr>
</tbody>
</table>

Response Elements

The elements in the following table are wrapped in a CreatePlacementGroupResponse element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request. Type: xsd:string</td>
</tr>
<tr>
<td>return</td>
<td>Returns true if the request succeeds. Otherwise, returns an error. Type: xsd:boolean</td>
</tr>
</tbody>
</table>

Examples

Example Request

This example creates a placement group named XYZ-cluster.

https://ec2.amazonaws.com/?Action=CreatePlacementGroup
&GroupName=XYZ-cluster
&Strategy=cluster
&AUTHPARAMS

Example Response

<CreatePlacementGroupResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/"/>
<requestId>d4904fd9-82c2-4ea5-adfe-a9cc3EXAMPLE</requestId>
<return>true</return>

CreateReservedInstancesListing

Description

Creates a new listing for Amazon EC2 Reserved Instances that will be sold in the Reserved Instance Marketplace. You can submit one Reserved Instance listing at a time.

The Reserved Instance Marketplace matches sellers who want to resell Reserved Instance capacity that they no longer need with buyers who want to purchase additional capacity. Reserved Instances bought and sold through the Reserved Instance Marketplace work like any other Reserved Instances.

If you want to sell your Reserved Instances, you must first register as a Seller in the Reserved Instance Marketplace. After completing the registration process, you can create a Reserved Instance Marketplace listing of some or all of your Reserved Instances, and specify the upfront price you want to receive for them. Your Reserved Instance listings then become available for purchase.

For more information about Reserved Instance Marketplace, go to Reserved Instance Marketplace in the Amazon Elastic Compute Cloud User Guide.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
</table>
| reservedInstancesId | The ID of the Reserved Instance that will be listed.  
Type: String  
Default: None | Yes      |
| instanceCount      | The number of instances that are a part of a Reserved Instance account that will be listed in the Reserved Instance Marketplace. This number should be less than or equal to the instance count associated with the Reserved Instance ID specified in this call.  
Type: Integer  
Default: None | Yes      |
| priceSchedules     | A list specifying the price of the Reserved Instance for each month remaining in the Reserved Instance term.  
Type:  
PriceScheduleRequestSetItemType (p. 503) | Yes      |
| clientToken        | Unique, case-sensitive identifier you provide to ensure idempotency of your listings. This helps avoid duplicate listings. For more information, go to Ensuring Idempotency in the Amazon Elastic Compute Cloud User Guide.  
Type: String  
Default: None | Yes      |
Response Elements

The elements in the following table are wrapped in a CreateReservedInstancesListingResponseType element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request to create the Reserved Instances listing. Type: String</td>
</tr>
<tr>
<td>reservedInstancesListingSet</td>
<td>The Reserved Instances listing that was created. The listing information is wrapped in an item element. Type: DescribeReservedInstancesListingsResponseSetItemType (p. 454)</td>
</tr>
</tbody>
</table>

Examples

Example Request

This example creates a Reserved Instance Marketplace listing from the existing Reserved Instance named f127bd27-a218-43a4-926d-870e8a4307c1, which has 11 months remaining in its term. In this example, we set the upfront price at $2.50, and the price drops over the course of the 11-month term if the instance is still not sold:

<table>
<thead>
<tr>
<th>Term (months)</th>
<th>Upfront Price</th>
</tr>
</thead>
<tbody>
<tr>
<td>11, 10, 9</td>
<td>$2.50</td>
</tr>
<tr>
<td>8, 7, 6</td>
<td>$2.00</td>
</tr>
<tr>
<td>5, 4</td>
<td>$1.50</td>
</tr>
<tr>
<td>3, 2</td>
<td>$0.70</td>
</tr>
<tr>
<td>1</td>
<td>$0.10</td>
</tr>
</tbody>
</table>

CreateRoute

Description

Creates a route in a route table within a VPC. The route's target can be either a gateway attached to the VPC or a NAT instance in the VPC.

When determining how to route traffic, we use the route with the most specific match. For example, let's say the traffic is destined for 192.0.2.3, and the route table includes the following two routes:

- 192.0.2.0/24 (goes to some target A)
- 192.0.2.0/28 (goes to some target B)

Both routes apply to the traffic destined for 192.0.2.3. However, the second route in the list covers a smaller number of IP addresses and is therefore more specific, so we use that route to determine where to target the traffic.

For more information about route tables, see Route Tables in the Amazon Virtual Private Cloud User Guide.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>RouteTableId</td>
<td>The ID of the route table where the route will be added.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td>DestinationCidrBlock</td>
<td>The CIDR address block used for the destination match. For example: 0.0.0.0/0. Routing decisions are based on the most specific match.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td>GatewayId</td>
<td>The ID of a gateway attached to your VPC.</td>
<td>Conditional</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Condition: You must provide only one of the following: a GatewayId, InstanceId, or NetworkInterfaceId.</td>
<td></td>
</tr>
<tr>
<td>InstanceId</td>
<td>The ID of a NAT instance in your VPC.</td>
<td>Conditional</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Condition: You must provide only one of the following: a GatewayId, InstanceId, or NetworkInterfaceId.</td>
<td></td>
</tr>
</tbody>
</table>
### Response Elements

The elements in the following table are wrapped in a `CreateRouteResponse` element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>NetworkInterfaceId</td>
<td>Allows the routing of network interface IDs. Exactly one interface must be attached when specifying an instance ID or it fails. Type: String Default: None Condition: You must provide only one of the following: a GatewayID, InstanceID, or NetworkInterfaceId.</td>
<td>Conditional</td>
</tr>
</tbody>
</table>

### Examples

#### Example Request

This example creates a route in the route table with ID rtb-e4ad488d. The route matches all traffic (0.0.0.0/0) and routes it to the Internet gateway with ID igw-eaad4883.

```
https://ec2.amazonaws.com/?Action=CreateRoute
&RouteTableId=rtb-e4ad488d
&DestinationCidrBlock=0.0.0.0/0
&GatewayId=igw-eaad4883
&AUTHPARAMS
```

#### Example Request

This example creates a route in the route table with ID rtb-g8ff4ea2. The route sends all traffic (0.0.0.0/0) to the NAT instance with ID i-1a2b3c4d.

```
https://ec2.amazonaws.com/?Action=CreateRoute
&RouteTableId=rtb-g8ff4ea2
&DestinationCidrBlock=0.0.0.0/0
&InstanceId=i-1a2b3c4d
&AUTHPARAMS
```
Example Response

```
<CreateRouteResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <return>true</return>
</CreateRouteResponse>
```

CreateRouteTable

Description

Creates a route table within a VPC. After you create a new route table, you can add routes and associate the table with a subnet. For more information about route tables, see Route Tables in the Amazon Virtual Private Cloud User Guide.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>VpcId</td>
<td>The ID of the VPC. Type: String Default: None</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Response Elements

The elements in the following table are wrapped in a CreateRouteTableResponse element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request received. Type: xsd:string</td>
</tr>
<tr>
<td>routeTable</td>
<td>Information about the newly created route table. Type: RouteTableType (p. 512)</td>
</tr>
</tbody>
</table>

Examples

Example Request

This example creates a route table within the VPC with ID of vpc-11ad4878.

```
https://ec2.amazonaws.com/?Action=CreateRouteTable
&VpcId=vpc-11ad4878
&AUTHPARAMS
```

Example Response

By default, every route table includes a local route that enables traffic to flow within the VPC. The following response shows that route.

```xml
CreateRouteTableResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01 />
         <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
         <routeTable>
             <routeTableId>rtb-f9ad4890</routeTableId>
```

- ReplaceRouteTableAssociation (p. 389)
- CreateRoute (p. 87)
CreateSecurityGroup

Description

Creates a new security group. You can create either an EC2 security group (which works only with EC2), or a VPC security group (which works only with Amazon Virtual Private Cloud). The two types of groups have different capabilities. For information about VPC security groups and how the two types of groups differ, see Security Groups in the Amazon Virtual Private Cloud User Guide. For information about EC2 security groups, see Using Security Groups in the Amazon Elastic Compute Cloud User Guide.

When you create a security group, you give it a friendly name of your choice. You can have an EC2 security group with the same name as a VPC security group (each group has a unique security group ID separate from the name). Two standard groups can't have the same name, and two VPC groups can't have the same name.

If you don't specify a security group when you launch an instance, the instance is launched into the default security group. This group (and only this group) includes a default rule that gives the instances in the group unrestricted network access to each other. You have a default EC2 security group for instances you launch with EC2 (i.e., outside a VPC), and a default VPC security group for instances you launch in your VPC.

You can add or remove rules from your security groups (i.e., authorize or revoke permissions) using the AuthorizeSecurityGroupIngress, AuthorizeSecurityGroupEgress, RevokeSecurityGroupIngress, and RevokeSecurityGroupEgress actions.

Important
For EC2 security groups: You can have up to 500 groups.
For VPC security groups: You can have up to 50 groups per VPC.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>GroupName</td>
<td>The name of the security group. Type: String</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Constraints: Accepts alphanumeric characters, spaces, dashes, and underscores.</td>
<td></td>
</tr>
<tr>
<td>GroupDescription</td>
<td>A description of the group. This is informational only. Type: String</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Constraints: Accepts alphanumeric characters, spaces, dashes, and underscores.</td>
<td></td>
</tr>
<tr>
<td>VpcId</td>
<td>The ID of the VPC. Type: String</td>
<td>Conditional</td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Condition: Required for VPC security groups</td>
<td></td>
</tr>
</tbody>
</table>
Response Elements

The elements in the following table are wrapped in a CreateSecurityGroupResponse element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request. Type: xsd:string</td>
</tr>
<tr>
<td>return</td>
<td>Returns true if the request succeeds. Otherwise, returns an error. Type: xsd:boolean</td>
</tr>
<tr>
<td>groupId</td>
<td>The ID that AWS assigns to the security group. Type: xsd:string</td>
</tr>
</tbody>
</table>

Examples

Example Request

This example creates the websrv security group.

https://ec2.amazonaws.com/?Action=CreateSecurityGroup
&GroupName=websrv
&GroupDescription=Web Servers
&AUTHPARAMS

Example Response

<CreateSecurityGroupResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <return>true</return>
  <groupId>sg-1a2b3c4d</groupId>
</CreateSecurityGroupResponse>

CreateSnapshot

Description

Creates a snapshot of an Amazon EBS volume and stores it in Amazon S3. You can use snapshots for backups, to make copies of instance store volumes, and to save data before shutting down an instance. For more information about Amazon EBS, see Using Amazon Elastic Block Store.

When a snapshot is created, any AWS Marketplace product codes from the volume are propagated to the snapshot.

When taking a snapshot of a file system, we recommend unmounting it first. This ensures the file system metadata is in a consistent state, that the ‘mounted indicator’ is cleared, and that all applications using that file system are stopped and in a consistent state. Some file systems, such as xfs, can freeze and unfreeze activity so a snapshot can be made without unmounting.

For Linux/UNIX, enter the following command from the command line to unmount the volume.

```
umount -d device_name
```

For example:

```
umount -d /dev/sdh
```

For Windows, open Disk Management, right-click the volume to unmount, and select Change Drive Letter and Path. Then, select the mount point to remove and click Remove.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>VolumeId</td>
<td>The ID of the Amazon EBS volume.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td>Description</td>
<td>A description of the Amazon EBS snapshot.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Constraints: Up to 255 characters</td>
<td></td>
</tr>
</tbody>
</table>

Response Elements

The elements in the following table are wrapped in a CreateSnapshotResponse element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request.</td>
</tr>
<tr>
<td></td>
<td>Type: xsd:string</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>snapshotId</td>
<td>The ID of the snapshot. Type: xsd:string</td>
</tr>
<tr>

<td>The ID of the volume. Type: xsd:string</td>
</tr>
<tr>
<td>status</td>
<td>The snapshot state. Type: xsd:string Valid values: pending</td>
</tr>
<tr>
<td>startTime</td>
<td>The time stamp when the snapshot was initiated. Type: xsd:dateTime</td>
</tr>
<tr>
<td>progress</td>
<td>The progress of the snapshot, as a percentage. Type: xsd:string</td>
</tr>
<tr>
<td>ownerId</td>
<td>The AWS account ID of the Amazon EBS snapshot owner. Type: xsd:string</td>
</tr>
<tr>
<td>volumeSize</td>
<td>The size of the volume, in GiB. Type: xsd:string</td>
</tr>
<tr>
<td>description</td>
<td>A description of the snapshot. Type: xsd:string</td>
</tr>
</tbody>
</table>

**Examples**

**Example Request**

This example creates a snapshot of volume `vol-4d826724`.

https://ec2.amazonaws.com/?Action=CreateSnapshot
&VolumeId=vol-4d826724
&Description=Daily+Backup
&AUTHPARAMS

**Example Response**

```xml
<CreateSnapshotResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <snapshotId>snap-78a54011</snapshotId>
  <volumeId>vol-4d826724</volumeId>
  <status>pending</status>
  <startTime>2008-05-07T12:51:50.000Z</startTime>
  <progress>60%</progress>
  <ownerId>111122223333</ownerId>
  <volumeSize>10</volumeSize>
  <description>Daily Backup</description>
</CreateSnapshotResponse>
```

CreateSpotDatafeedSubscription

Description

Creates the datafeed for Spot Instances, enabling you to view Spot Instance usage logs. You can create one data feed per account. For more information about Spot Instances, see Spot Instances in the Amazon Elastic Compute Cloud User Guide.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bucket</td>
<td>The Amazon S3 bucket in which to store the Spot Instance datafeed. Type: String Default: None Constraints: Must be a valid bucket associated with your account.</td>
<td>Yes</td>
</tr>
<tr>
<td>Prefix</td>
<td>A prefix that is prepended to datafeed files. Type: String Default: None</td>
<td>No</td>
</tr>
</tbody>
</table>

Response Elements

The elements in the following table are wrapped in a CreateSpotDatafeedSubscriptionResponse element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request. Type: xsd:string</td>
</tr>
<tr>
<td>spotDatafeedSubscription</td>
<td>The datafeed subscription. Type: SpotDatafeedSubscriptionType (p. 519)</td>
</tr>
</tbody>
</table>

Examples

Example Request

This example creates the data feed for the account.

https://ec2.amazonaws.com/?Action=CreateSpotDatafeedSubscription &Bucket=myawsbucket &AUTHPARAMS
Example Response

```xml
<CreateSpotDatafeedSubscriptionResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <spotDatafeedSubscription>
    <ownerId>111122223333</ownerId>
    <bucket>myawsbucket</bucket>
    <prefix/>
    <state>Active</state>
  </spotDatafeedSubscription>
</CreateSpotDatafeedSubscriptionResponse>
```

Related Operations

- DeleteSpotDatafeedSubscription (p. 143)

CreateSubnet

**Description**

Creates a subnet in an existing VPC. You can create up to 20 subnets in a VPC. If you add more than one subnet to a VPC, they're set up in a star topology with a logical router in the middle. If you need more than 20 subnets, you can request more by going to [http://aws.amazon.com/contact-us/vpc-request/](http://aws.amazon.com/contact-us/vpc-request/).

When you create each subnet, you provide the VPC ID and the CIDR block you want for the subnet. After you create a subnet, you can't change its CIDR block. The subnet's CIDR block can be the same as the VPC's CIDR block (assuming you want only a single subnet in the VPC), or a subset of the VPC's CIDR block. If you create more than one subnet in a VPC, the subnets' CIDR blocks must not overlap. The smallest subnet (and VPC) you can create uses a /28 netmask (16 IP addresses), and the largest uses a /16 netmask (65,536 IP addresses).

**Important**

AWS reserves both the first four and the last IP address in each subnet's CIDR block. They're not available for use.

If you launch an instance in a VPC using an Amazon EBS-backed AMI, the IP address doesn't change if you stop and restart the instance (unlike a similar instance launched outside a VPC, which gets a new IP address when restarted). It's therefore possible to have a subnet with no running instances (they're all stopped), but no remaining IP addresses available. For more information about Amazon EBS-backed AMIs, see AMI Basics in the Amazon Elastic Compute Cloud User Guide.

For more information about Amazon Virtual Private Cloud and subnets, see the Amazon Virtual Private Cloud User Guide.

**Request Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>VpcId</td>
<td>The ID of the VPC. Type: String Default: None</td>
<td>Yes</td>
</tr>
<tr>
<td>CidrBlock</td>
<td>The CIDR block for the subnet to cover (for example, 10.0.0.0/24). Type: String Default: None</td>
<td>Yes</td>
</tr>
<tr>
<td>AvailabilityZone</td>
<td>The Availability Zone for the subnet. Type: String Default: AWS selects a zone for you (recommended)</td>
<td>No</td>
</tr>
</tbody>
</table>

**Response Elements**

The elements in the following table are wrapped in a CreateSubnetResponse element.
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request.</td>
</tr>
<tr>
<td></td>
<td>Type: xsd:string</td>
</tr>
<tr>
<td>subnet</td>
<td>Information about the subnet.</td>
</tr>
<tr>
<td></td>
<td>Type: SubnetType (p. 524)</td>
</tr>
</tbody>
</table>

### Examples

#### Example Request

This example creates a subnet with CIDR block 10.0.1.0/24 in the VPC with ID vpc-1a2b3c4d.

```plaintext
https://ec2.amazonaws.com/?Action=CreateSubnet
&VpcId=vpc-1a2b3c4d
&CidrBlock=10.0.1.0/24
&AUTHPARAMS
```

#### Example Response

```xml
<CreateSubnetResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
  <requestId>7a62c49f-347e-4fc4-9331-6e8eEXAMPLE</requestId>
  <subnet>
    <subnetId>subnet-9d4a7b6c</subnetId>
    <state>pending</state>
    <vpcId>vpc-1a2b3c4d</vpcId>
    <cidrBlock>10.0.1.0/24</cidrBlock>

CreateTags

Description

Adds or overwrites one or more tags for the specified EC2 resource or resources. Each resource can have a maximum of 10 tags. Each tag consists of a key and optional value. Tag keys must be unique per resource.

For more information about tags, see Using Tags in the Amazon Elastic Compute Cloud User Guide.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>ResourceId.n</td>
<td>The ID of a resource to tag. For example, ami-1a2b3c4d. You can specify multiple resources to assign the tags to. Type: String Default: None</td>
<td>Yes</td>
</tr>
<tr>
<td>Tag.n.Key</td>
<td>The key for a tag. Type: String Default: None Constraints: Tag keys are case sensitive and accept a maximum of 128 Unicode characters.</td>
<td>Yes</td>
</tr>
<tr>
<td>Tag.n.Value</td>
<td>The value for a tag. If you don't want the tag to have a value, specify the parameter with no value, and we set the value to an empty string. Type: String Default: None Constraints: Tag values are case sensitive and accept a maximum of 256 Unicode characters.</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Response Elements

The elements in the following table are wrapped in a CreateTagsResponse element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request. Type: xsd:string</td>
</tr>
<tr>
<td>return</td>
<td>Returns true if the request succeeds. Otherwise, returns an error. Type: xsd:boolean</td>
</tr>
</tbody>
</table>
Examples

Example Request

This example adds (or overwrites) two tags for an AMI and an instance. One of the tags is just a key (webserver), with no value (we set the value to an empty string). The other consists of a key (stack) and value (Production).

https://ec2.amazonaws.com/?Action=CreateTags
<ResourceId.1=ami-1a2b3c4d
<ResourceId.2=i-7f4d3a2b
<Tag.1.Key=webserver
<Tag.1.Value=
<Tag.2.Key=stack
<Tag.2.Value=Production
&AUTHPARAMS

Example Response

<CreateTagsResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
  <requestId>7a62c49f-347e-4fc4-9331-6e8eEXAMPLE</requestId>
  <return>true</return>
</CreateTagsResponse>

Related Operations

CreateVolume

Description

Creates an Amazon EBS volume that can be attached to any Amazon EC2 instance in the same Availability Zone. Any AWS Marketplace product codes from the snapshot are propagated to the volume. For more information about Amazon EBS, see Amazon Elastic Block Store.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Size</td>
<td>The size of the volume, in GiBs.</td>
<td>Conditional</td>
</tr>
<tr>
<td>Type: String</td>
<td>Valid values: 1-1024</td>
<td></td>
</tr>
<tr>
<td>Valid values: If the volume type is io1, the minimum size of the volume is 10 GiB.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Default: If you're creating the volume from a snapshot and don't specify a volume size, the default is the snapshot size.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Condition: Required unless you're creating the volume from a snapshot.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>SnapshotId</td>
<td>The snapshot from which to create the new volume.</td>
<td>Conditional</td>
</tr>
<tr>
<td>Type: String</td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td>Condition: Required if you are creating a volume from a snapshot.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>AvailabilityZone</td>
<td>The Availability Zone for the new volume. Use DescribeAvailabilityZones (p. 166) to display Availability Zones that are currently available to your account.</td>
<td>Yes</td>
</tr>
<tr>
<td>Type: String</td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td>VolumeType</td>
<td>The volume type.</td>
<td>No</td>
</tr>
<tr>
<td>Type: String</td>
<td>Valid values: standard</td>
<td>io1</td>
</tr>
<tr>
<td>Default: standard</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Iops</td>
<td>The number of I/O operations per second (IOPS) that the volume supports.</td>
<td>Conditional</td>
</tr>
<tr>
<td>Type: Integer</td>
<td>Valid values: Range is 100 to 2000.</td>
<td></td>
</tr>
<tr>
<td>Default: None</td>
<td>Condition: Required when the volume type is io1; not used with standard volumes.</td>
<td></td>
</tr>
</tbody>
</table>

CreateVpc

Description

Creates a VPC with the specified CIDR block. The smallest VPC you can create uses a /28 netmask (16 IP addresses), and the largest uses a /16 netmask (65,536 IP addresses). To help you decide how big to make your VPC, see Your VPC and Subnets in the Amazon Virtual Private Cloud User Guide.

By default, each instance you launch in the VPC has the default DHCP options, which includes only a default DNS server that we provide (AmazonProvidedDNS). For more information about Amazon Virtual Private Cloud and DHCP options, see Using DHCP Options in Your VPC in the Amazon Virtual Private Cloud User Guide.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>CidrBlock</td>
<td>The CIDR block you want the VPC to cover (for example, 10.0.0.0/16).</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td>instanceTenancy</td>
<td>The supported tenancy of instances launched into the VPC. A value of default means that instances can be launched with any tenancy; a value of dedicated means all instances are launched as dedicated tenancy instances regardless of the tenancy assigned to the instance at launch. Setting the instance tenancy to dedicated runs your instance on single-tenant hardware.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: default</td>
<td></td>
</tr>
</tbody>
</table>

Response Elements

The elements in the following table are wrapped in an CreateVpcResponse element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request.</td>
</tr>
<tr>
<td></td>
<td>Type: xsd:string</td>
</tr>
<tr>
<td>vpc</td>
<td>Information about the VPC.</td>
</tr>
<tr>
<td></td>
<td>Type: VpcType (p. 531)</td>
</tr>
</tbody>
</table>
Examples

Example Request
This example creates a VPC with CIDR block 10.0.0.0/16.

https://ec2.amazonaws.com/?Action=CreateVpc
&CidrBlock=10.0.0.0/16
&AUTHPARAMS

Example Response

<?xml version="1.0" encoding="UTF-8"?>
<CreateVpcResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/"
><requestId>7a62c49f-347e-4fc4-9331-6e8eEXAMPLE</requestId>

CreateVpnConnection

Description

Creates a VPN connection between an existing virtual private gateway and a VPN customer gateway. The only supported connection type is `ipsec.1`.

The response includes information that you need to configure your customer gateway, in XML format. We recommend that you use the command line version of this operation (ec2-create-vpn-connection), which lets you get the configuration information formatted in a friendlier way. For information about the command, see ec2-create-vpn-connection in the Amazon Elastic Compute Cloud Command Line Reference.

Important

We strongly recommend that you use HTTPS when calling this operation because the response contains sensitive cryptographic information for configuring your customer gateway.

If you shut down your VPN connection for any reason and later create a new VPN connection, you must reconfigure your customer gateway with the new information returned from CreateVpnConnection.

For more information about Amazon Virtual Private Cloud and VPN connections, see Adding an IPsec Hardware Virtual Private Gateway to Your VPC in the Amazon Virtual Private Cloud User Guide.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>The type of VPN connection. Type: String Default: None Valid values: ipsec.1</td>
<td>Yes</td>
</tr>
<tr>
<td>CustomerGatewayId</td>
<td>The ID of the customer gateway. Type: String Default: None</td>
<td>Yes</td>
</tr>
<tr>
<td>VpnGatewayId</td>
<td>The ID of the virtual private gateway. Type: String Default: None</td>
<td>Yes</td>
</tr>
<tr>
<td>AvailabilityZone</td>
<td>Deprecated. The action ignores this parameter. Type: String Default: None</td>
<td>No</td>
</tr>
<tr>
<td>Options.StaticRoutesOnly</td>
<td>Indicates whether the VPN connection requires static routes. If you are creating a VPN connection for a device that does not support BGP, you must specify true. Type: Boolean Default: false</td>
<td>No</td>
</tr>
</tbody>
</table>
Response Elements

The elements in the following table are wrapped in a `CreateVpnConnectionResponse` element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request.</td>
</tr>
<tr>
<td></td>
<td>Type: xsd:string</td>
</tr>
<tr>
<td>vpnConnection</td>
<td>Information about the VPN connection.</td>
</tr>
<tr>
<td></td>
<td>Type: <code>VpnConnectionType</code> (p. 532)</td>
</tr>
</tbody>
</table>

Examples

Example Request

This example creates a VPN connection between the virtual private gateway (VGW) with ID `vgw-8db04f81` and the customer gateway with ID `cgw-b4dc3961`. The response includes configuration information for the VPN connection's customer gateway (in the native XML format, but escaped).

```
https://ec2.amazonaws.com/?Action=CreateVpnConnection
&Type=ipsec.1
&CustomerGatewayId=cgw-b4dc3961
&VpnGatewayId=vgw-8db04f81
&AUTHPARAMS
```

Example Response

```
<CreateVpnConnectionResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
  <requestId>7a62c49f-347e-4fc4-9331-6e8eEXAMPLE</requestId>

CreateVpnConnectionRoute

Description

Creates a new static route associated with a VPN connection between an existing virtual private gateway and a VPN customer gateway. The static route allows traffic to be routed from the virtual private gateway to the VPN customer gateway.

Important
We strongly recommend you use HTTPS when calling this operation because the response contains sensitive cryptographic information for configuring your customer gateway.

For more information about Amazon Virtual Private Cloud and VPN connections, see Adding an IPsec Hardware Virtual Private Gateway to Your VPC in the Amazon Virtual Private Cloud User Guide.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>DestinationCidrBlock</td>
<td>The CIDR block associated with the local subnet of the customer data center. Type: String Default: None</td>
<td>Yes</td>
</tr>
<tr>
<td>VpnConnectionId</td>
<td>The ID of the VPN connection. Type: String Default: None</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Response Elements

The elements in the following table are wrapped in a CreateVpnConnectionRouteResponse element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>

<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>DhcpOptionsId</td>
<td>The ID of the DHCP options set.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
</tbody>
</table>

Response Elements

The elements in the following table are wrapped in a `DeleteDhcpOptionsResponse` element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request.</td>
</tr>
<tr>
<td></td>
<td>Type: xsd:string</td>
</tr>
<tr>
<td>return</td>
<td>Returns true if the request succeeds. Otherwise, returns an error.</td>
</tr>
<tr>
<td></td>
<td>Type: xsd:boolean</td>
</tr>
</tbody>
</table>

Examples

Example Request

This example deletes the set of DHCP options with ID dopt-7a8b9c2d.

https://ec2.amazonaws.com/?Action=DeleteDhcpOptions&DhcpOptionsId=dopt-7a8b9c2d&AUTHPARAMS

Example Response

```xml
<DeleteDhcpOptionsResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
  <requestId>7a62c49f-347e-4fc4-9331-6e8eEXAMPLE</requestId>
</DeleteDhcpOptionsResponse>
```

DeleteInternetGateway

Description

Deletes an Internet gateway from your AWS account. The gateway must not be attached to a VPC. For more information about your VPC and Internet gateway, see the Amazon Virtual Private Cloud User Guide.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>InternetGatewayId</td>
<td>The ID of the Internet gateway. Type: String Default: None</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Response Elements

The elements in the following table are wrapped in a DeleteInternetGatewayResponse element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request. Type: String</td>
</tr>
<tr>
<td>return</td>
<td>Returns true if the request succeeds. Otherwise, returns an error. Type: xsd:boolean</td>
</tr>
</tbody>
</table>

Examples

Example Request

This example deletes the Internet gateway with ID igw-ead4883.

https://ec2.amazonaws.com/?Action=DeleteInternetGateway
&InternetGatewayId=igw-ead4883
&AUTHPARAMS

Example Response

<DeleteInternetGatewayResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <return>true</return>
</DeleteInternetGatewayResponse>
Related Operations

DeleteKeyPair

Description
Deletes the specified key pair, by removing the public key from Amazon EC2. You must own the key pair.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>KeyName</td>
<td>The name of the key pair.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
</tbody>
</table>

Response Elements
The elements in the following table are wrapped in a DeleteKeyPairResponse element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request.</td>
</tr>
<tr>
<td></td>
<td>Type: xsd:string</td>
</tr>
<tr>
<td>return</td>
<td>Returns true if the request succeeds. Otherwise, returns an error.</td>
</tr>
<tr>
<td></td>
<td>Type: xsd:boolean</td>
</tr>
</tbody>
</table>

Examples

Example Request
This example deletes the gsg-keypair key pair.

https://ec2.amazonaws.com/?Action=DeleteKeyPair&KeyName=gsg-keypair

Example Response

<DeleteKeyPairResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <return>true</return>
</DeleteKeyPairResponse>

DeleteNetworkAcl

Description

Deletes a network ACL from a VPC. The ACL must not have any subnets associated with it. You can't delete the default network ACL. For more information about network ACLs, see Network ACLs in the Amazon Virtual Private Cloud User Guide.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>NetworkAclId</td>
<td>The ID of the network ACL.</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Type: String

Default: None

Response Elements

The elements in the following table are wrapped in a DeleteNetworkAclResponse element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request.</td>
</tr>
<tr>
<td></td>
<td>Type: xsd:string</td>
</tr>
<tr>
<td>return</td>
<td>Returns true if the request succeeds. Otherwise, returns an error.</td>
</tr>
<tr>
<td></td>
<td>Type: xsd:boolean</td>
</tr>
</tbody>
</table>

Examples

Example Request

This example deletes the network ACL with ID acl-2cb85d45.

https://ec2.amazonaws.com/?Action=DeleteNetworkAcl
&NetworkAclId=acl-2cb85d45
&AUTHPARAMS

Example Response

<DeleteNetworkAclResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
    <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
    <return>true</return>
</DeleteNetworkAclResponse>
Related Operations

DeleteNetworkAclEntry

Description

Deletes an ingress or egress entry (i.e., rule) from a network ACL. For more information about network ACLs, see Network ACLs in the Amazon Virtual Private Cloud User Guide.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>NetworkAclId</td>
<td>The ID of the network ACL. Type: String Default: none</td>
<td>Yes</td>
</tr>
<tr>
<td>RuleNumber</td>
<td>The rule number for the entry to delete. Type: Integer Default: none</td>
<td>Yes</td>
</tr>
<tr>
<td>Egress</td>
<td>Specifies whether the rule to delete is an egress rule (true) or ingress rule (false). Type: Boolean Default: false Valid values: true</td>
<td>No</td>
</tr>
</tbody>
</table>

Response Elements

The elements in the following table are wrapped in a DeleteNetworkAclEntryResponse element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request. Type: xsd:string</td>
</tr>
<tr>
<td>return</td>
<td>Returns true if the request succeeds. Otherwise, returns an error. Type: xsd:boolean</td>
</tr>
</tbody>
</table>

Examples

Example Request

This example deletes the ingress entry with rule number 100 from the network ACL with ID acl-2cb85d45.

https://ec2.amazonaws.com/?Action=DeleteNetworkAclEntry
&NetworkAclId=acl-2cb85d45
&RuleNumber=100
&AUTHPARAMS
Example Response

```xml
/DeleteNetworkAclEntryResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/"

  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <return>true</return>
</DeleteNetworkAclEntryResponse>
```

DeleteNetworkInterface

Description
Deletees the specified network interface.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>NetworkInterfaceId</td>
<td>The ID of the network interface.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
</tbody>
</table>

Response Elements
The elements in the following table are wrapped in a DeleteNetworkInterfaceResponse element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request to delete the network interface. Type: xsd:string</td>
</tr>
<tr>
<td>return</td>
<td>Returns true if the request succeeds. Otherwise, returns an error. Type: xsd:boolean</td>
</tr>
</tbody>
</table>

Examples

Example Request
This example deletes an elastic network interface (ENI) eni-ffda3197.

https://ec2.amazonaws.com/?Action=DeleteNetworkInterface
&NetworkInterfaceId=eni-ffda3197
&AUTHPARAMS

Example Response

   <requestId>e1c6d73b-edaa-4e62-9909-6611404e1739</requestId>
   <return>true</return>
</DeleteNetworkInterfaceResponse>

DeletePlacementGroup

**Description**

Deletes a placement group from your account. You must terminate all instances in the placement group before deleting it. For more information about placement groups and cluster instances, see Using Cluster Instances in the Amazon Elastic Compute Cloud User Guide.

**Request Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>GroupName</td>
<td>The name of the placement group. Type: String Default: None</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Response Elements**

The elements in the following table are wrapped in a `DeletePlacementGroupResponse` element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request. Type: xsd:string</td>
</tr>
<tr>
<td>return</td>
<td>Returns true if the request succeeds. Otherwise, returns an error. Type: xsd:boolean</td>
</tr>
</tbody>
</table>

**Examples**

**Example Request**

This example deletes the placement group named XYZ-cluster.

https://ec2.amazonaws.com/?Action=DeletePlacementGroup &GroupName=XYZ-cluster &AUTHPARAMS

**Example Response**

```
<DeletePlacementGroupResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
  <requestId>d4904fd9-82c2-4ea5-adfe-a9cc3EXAMPLE</requestId>
  <return>true</return>
</DeletePlacementGroupResponse>
```

DeleteRoute

Description

Deletes a route from a route table in a VPC. For more information about route tables, see Route Tables in the Amazon Virtual Private Cloud User Guide.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>RouteTableId</td>
<td>The ID of the route table. Type: String Default: None</td>
<td>Yes</td>
</tr>
<tr>
<td>DestinationCidrBlock</td>
<td>The CIDR range for the route to delete. The value you specify must exactly match the CIDR for the route. Type: String Default: None</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Response Elements

The elements in the following table are wrapped in a ReplaceRouteResponse element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request. Type: xsd:string</td>
</tr>
<tr>
<td>return</td>
<td>Returns true if the request succeeds. Otherwise, returns an error. Type: xsd:boolean</td>
</tr>
</tbody>
</table>

Examples

Example Request

This example removes the route with destination CIDR 172.16.1.0/24 from the route table with ID rtb-e4ad488d.

https://ec2.amazonaws.com/?Action=DeleteRoute &RouteTableId=rtb-e4ad488d &DestinationCidrBlock=172.16.1.0/24 &AUTHPARMS
Example Response

```xml
<DeleteRouteResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
    <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
    <return>true</return>
</DeleteRouteResponse>
```

DeleteRouteTable

Description

Deletes a route table from a VPC. The route table must not be associated with a subnet. You can't delete the main route table. For more information about route tables, see Route Tables in the Amazon Virtual Private Cloud User Guide.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>RouteTableId</td>
<td>The ID of the route table.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
</tbody>
</table>

Response Elements

The elements in the following table are wrapped in a DeleteRouteTableResponse element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request. Type: xsd:string</td>
</tr>
<tr>
<td>return</td>
<td>Returns true if the request succeeds. Otherwise, returns an error. Type: xsd:boolean</td>
</tr>
</tbody>
</table>

Examples

Example Request

This example deletes the route table with ID rtb-e4ad488d.

https://ec2.amazonaws.com/?Action=DeleteRouteTable
&RouteTableId=rtb-e4ad488d
&AUTHPARAMS

Example Response

<DeleteRouteTableResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <return>true</return>
</DeleteRouteTableResponse>
Related Operations

DeleteSecurityGroup

Description

Deletes a security group. This action applies to both EC2 security groups and VPC security groups. For information about VPC security groups and how they differ from EC2 security groups, see Security Groups in the Amazon Virtual Private Cloud User Guide.

Note

If you attempt to delete a security group that contains instances, or attempt to delete a security group that is referenced by another security group, an error is returned. For example, if security group B has a rule that allows access from security group A, security group A cannot be deleted until the rule is removed.

The fault returned is InvalidGroup.InUse for EC2 security groups, or DependencyViolation for VPC security groups.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
</table>
| GroupName | The name of the security group. Type: String  
Default: None  
Condition: Either GroupName or GroupId is required | Conditional |
| GroupId  | The ID of the security group. Type: String  
Default: None  
Condition: Required for a VPC security group; for an EC2 security group, either GroupName or GroupId is required | Conditional |

Response Elements

The elements in the following table are wrapped in a DeleteSecurityGroupResponse element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request. Type: xsd:string</td>
</tr>
<tr>
<td>return</td>
<td>Returns true if the request succeeds. Otherwise, returns an error. Type: xsd:boolean</td>
</tr>
</tbody>
</table>

Examples

Example Request

This example deletes the EC2 security group named websrv.
Example Request

This example deletes the VPC security group with ID sg-77d0f5a2.

Example Response

```xml
<DeleteSecurityGroupResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <return>true</return>
</DeleteSecurityGroupResponse>
```

DeleteSnapshot

Description

Deletes a snapshot of an Amazon EBS volume.

Note

If you make periodic snapshots of a volume, the snapshots are incremental so that only the blocks on the device that have changed since your last snapshot are incrementally saved in the new snapshot. Even though snapshots are saved incrementally, the snapshot deletion process is designed so that you need to retain only the most recent snapshot in order to restore the volume.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>SnapshotId</td>
<td>The ID of the Amazon EBS snapshot. Type: String Default: None</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Response Elements

The elements in the following table are wrapped in a `DeleteSnapshotResponse` element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request. Type: xsd:string</td>
</tr>
<tr>
<td>return</td>
<td>Returns true if the request succeeds. Otherwise, returns an error. Type: xsd:boolean</td>
</tr>
</tbody>
</table>

Examples

Example Request

This example deletes snapshot snap-78a54011.

https://ec2.amazonaws.com/?Action=DeleteSnapshot
&SnapshotId.1=snap-78a54011
&AUTHPARAMS

Example Response

```xml
<DeleteSnapshotResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
</DeleteSnapshotResponse>
```
<return>true</return>
</DeleteSnapshotResponse>

DeleteSpotDatafeedSubscription

Description

Deletes the datafeed for Spot Instances. For more information about Spot Instances, see Spot Instances in the Amazon Elastic Compute Cloud User Guide.

Request Parameters

The DeleteSpotDatafeedSubscription operation does not have any request parameters.

Response Elements

The elements in the following table are wrapped in a DeleteSpotDatafeedSubscriptionResponse element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request. Type: xsd:string</td>
</tr>
<tr>
<td>return</td>
<td>Returns true if the request succeeds. Otherwise, returns an error. Type: xsd:boolean</td>
</tr>
</tbody>
</table>

Examples

Example Request

This example deletes the data feed for the account.

https://ec2.amazonaws.com/?Action=DeleteSpotDatafeedSubscription &AUTHPARAMS

Example Response

<?xml version="1.0" encoding="UTF-8"?>
<DeleteSpotDatafeedSubscriptionResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <return>true</return>
</DeleteSpotDatafeedSubscriptionResponse>

Related Operations

- CreateSpotDatafeedSubscription (p. 97)

DeleteSubnet

Description

Deletes a subnet from a VPC. You must terminate all running instances in the subnet before deleting it, otherwise Amazon VPC returns an error.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>SubnetId</td>
<td>The ID of the subnet. Type: String Default: None</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Response Elements

The elements in the following table are wrapped in an DeleteSubnetResponse element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request. Type: xsd:string</td>
</tr>
<tr>
<td>return</td>
<td>Returns true if the request succeeds. Otherwise, returns an error. Type: xsd:boolean</td>
</tr>
</tbody>
</table>

Examples

Example Request

This example deletes the subnet with ID subnet-9d4a7b6c.

https://ec2.amazonaws.com/?Action=DeleteSubnet &SubnetId=subnet-9d4a7b6c &AUTHPARAMS

Example Response

<DeleteSubnetResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
   <requestId>7a62c49f-347e-4fc4-9331-6e8eEXAMPLE</requestId>
   <return>true</return>
</DeleteSubnetResponse>
Related Operations

- CreateSubnet (p. 99)
- DescribeSubnets (p. 294)
DeleteTags

Description

Deletes a specific set of tags from a specific set of resources. This call is designed to follow a DescribeTags call. You first determine what tags a resource has, and then you call DeleteTags with the resource ID and the specific tags you want to delete.

For more information about tags, see Using Tags in the Amazon Elastic Compute Cloud User Guide.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>resourceId.n</td>
<td>The ID of the resource. For example, ami-1a2b3c4d. You can specify more than one resource ID. Type: String Default: None</td>
<td>Yes</td>
</tr>
<tr>
<td>Tag.n.Key</td>
<td>The tag’s key. You can specify more than one tag to delete. Type: String Default: None</td>
<td>Yes</td>
</tr>
<tr>
<td>Tag.n.Value</td>
<td>The tag’s value. Type: String Default: If you omit this parameter, we delete the tag regardless of its value. If you specify this parameter with an empty string as the value, we delete the key only if its value is an empty string.</td>
<td>No</td>
</tr>
</tbody>
</table>

Response Elements

The elements in the following table are wrapped in a DeleteTagsResponse element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request. Type: xsd:string</td>
</tr>
<tr>
<td>return</td>
<td>Returns true if the request succeeds. Otherwise, returns an error. Type: xsd:boolean</td>
</tr>
</tbody>
</table>

Examples

Example Request

This example deletes the tags for the AMI with ID ami-1a2b3c4d. You first get a list of the tags.
Sample response:

```xml
<DescribeTagsResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/" requestId="7a62c49f-347e-4fc4-9331-6e8eEXAMPLE">
  <tagSet>
    <item>
      <resourceId>ami-1a2b3c4d</resourceId>
      <resourceType>image</resourceType>
      <key>webserver</key>
      <value/>
    </item>
    <item>
      <resourceId>ami-1a2b3c4d</resourceId>
      <resourceType>image</resourceType>
      <key>stack</key>
      <value>Production</value>
    </item>
  </tagSet>
</DescribeTagsResponse>
```

Then you delete the tags. Specifying the value for the `stack` tag is optional.

Sample response:

```xml
<DeleteTagsResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/" requestId="7a62c49f-347e-4fc4-9331-6e8eEXAMPLE">
  <return>true</return>
</DeleteTagsResponse>
```

**Example Request**

This example deletes the stack tag from two particular instances.

```
https://ec2.amazonaws.com/?Action=DeleteTags
&ResourceId.1=i-5f4e3d2a
&Tag.1.Key=stack
&ResourceId.2=i-12345678
&Tag.2.Key=stack
&AUTHPARAMS
```

**Example Request**

This example deletes the stack and webserver tags for one particular instance.
Example Request

You can specify a tag key without a corresponding tag value if you want to delete the tag regardless of its value. This example deletes all tags whose key=Purpose, regardless of the tag value.

```
https://ec2.amazonaws.com/?Action=DeleteTags
&ResourceId.1=i-5f4e3d2a
&Tag.1.Key=stack
&ResourceId.2=i-5f4e3d2a
&Tag.2.Key=webserver
&AUTHPARAMS
```

Example Request

When you create a tag, you can set the tag value to the empty string. Correspondingly, you can delete only tags that have a specific key and whose value is the empty string. This example deletes all tags for the specified instance where key=Purpose and the tag value is the empty string.

```
https://ec2.amazonaws.com/?Action=DeleteTags
&ResourceId.1=i-5f4e3d2a
&Tag.1.Key=Purpose
&Tag.2.Value=
&AUTHPARAMS
```

DeleteVolume

Description

Deletes an Amazon EBS volume. The volume must be in the available state (not attached to an instance). For more information about Amazon EBS, see Using Amazon Elastic Block Store in the Amazon Elastic Compute Cloud User Guide.

Note

The volume remains in the deleting state for several minutes after you call this action.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>VolumeId</td>
<td>The ID of the volume.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
</tbody>
</table>

Response Elements

The elements in the following table are wrapped in a DeleteVolumeResponse element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request. Type: xsd:string</td>
</tr>
<tr>
<td>return</td>
<td>Returns true if the request succeeds. Otherwise, returns an error. Type: xsd:boolean</td>
</tr>
</tbody>
</table>

Examples

Example Request

This example deletes volume vol-4282672b.

https://ec2.amazonaws.com/?Action=DeleteVolume
&VolumeId=vol-4282672b
&AUTHPARAMS

Example Response

<DeleteVolumeResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <return>true</return>
</DeleteVolumeResponse>
Related Operations

DeleteVpc

Description

Deletes a VPC. You must detach or delete all gateways or other objects that are dependent on the VPC first. For example, you must terminate all running instances, delete all VPC security groups (except the default), delete all the route tables (except the default), and so on.

For more information about Amazon Virtual Private Cloud and VPCs, see the Amazon Virtual Private Cloud User Guide.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>VpcId</td>
<td>The ID of the VPC. Type: String Default: None</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Response Elements

The elements in the following table are wrapped in a `DeleteVpcResponse` element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request. Type: xsd:string</td>

DeleteVpnConnection

Description

Deletes a VPN connection. Use this if you want to delete a VPC and all its associated components. Another reason to use this operation is if you believe the tunnel credentials for your VPN connection have been compromised. In that situation, you can delete the VPN connection and create a new one that has new keys, without needing to delete the VPC or virtual private gateway. If you create a new VPN connection, you must reconfigure the customer gateway using the new configuration information returned with the new VPN connection ID.

If you're deleting the VPC and all its associated parts, we recommend you detach the virtual private gateway from the VPC and delete the VPC before deleting the VPN connection.

For more information about Amazon Virtual Private Cloud and VPN connections, see Adding an IPsec Hardware Virtual Private Gateway to Your VPC in the *Amazon Virtual Private Cloud User Guide*.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>VpnConnectionId</td>
<td>The ID of the VPN connection. Type: String Default: None</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Response Elements

The elements in the following table are wrapped in an `DeleteVpnConnectionResponse` element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request. Type: xsd:string</td>
</tr>
<tr>
<td>return</td>
<td>Returns true if the request succeeds. Otherwise, returns an error. Type: xsd:boolean</td>
</tr>
</tbody>
</table>

Examples

Example Request

This example deletes the VPN connection with ID vpn-44a8938f.

https://ec2.amazonaws.com/?Action=DeleteVpnConnection&vnpConnectionId=vpn-44a8938f&AUTHPARAMS
Example Response

```xml
<DeleteVpnConnectionResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
  <requestId>7a62c49f-347e-4fc4-9331-6e8eEXAMPLE</requestId>
  <return>true</return>
</DeleteVpnConnectionResponse>
```

DeleteVpnConnectionRoute

Description

Deletes a static route associated with a VPN connection between an existing virtual private gateway and a VPN customer gateway. The static route allows traffic to be routed from the virtual private gateway to the VPN customer gateway.

Important

We strongly recommend you use HTTPS when calling this operation because the response contains sensitive cryptographic information for configuring your customer gateway.

For more information about Amazon Virtual Private Cloud and VPN connections, see Adding an IPsec Hardware Virtual Private Gateway to Your VPC in the Amazon Virtual Private Cloud User Guide.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>DestinationCidrBlock</td>
<td>The CIDR block associated with the local subnet of the customer data center.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td>VpnConnectionId</td>
<td>The ID of the VPN connection.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
</tbody>
</table>

Response Elements

The elements in the following table are wrapped in a DeleteVpnConnectionRouteResponse element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request.</td>
</tr>
<tr>

DeleteVpnGateway

Description

Deletes a virtual private gateway. Use this when you want to delete a VPC and all its associated components because you no longer need them. We recommend that before you delete a virtual private gateway, you detach it from the VPC and delete the VPN connection. Note that you don't need to delete the virtual private gateway if you just want to delete and recreate the VPN connection between your VPC and data center.

For more information about Amazon Virtual Private Cloud and virtual private gateways, see Adding an IPsec Hardware Virtual Private Gateway to Your VPC in the Amazon Virtual Private Cloud User Guide.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>VpnGatewayId</td>
<td>The ID of the virtual private gateway. Type: String</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
</tbody>
</table>

Response Elements

The elements in the following table are wrapped in a `DeleteVpnGatewayResponse` element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request. Type: xsd:string</td>
</tr>
<tr>
<td>return</td>
<td>Returns true if the request succeeds. Otherwise, returns an error. Type: xsd:boolean</td>
</tr>
</tbody>
</table>

Examples

Example Request

This example deletes the virtual private gateway with ID vgw-8db04f81.

https://ec2.amazonaws.com/?Action=DeleteVpnGateway &vpnGatewayId=vgw-8db04f81 &AUTHPARAMS
Example Response

```xml
<DeleteVpnGatewayResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
  <requestId>7a62c49f-347e-4fc4-9331-6e8eEXAMPLE</requestId>
  <return>true</return>
</DeleteVpnGatewayResponse>
```

DeregisterImage

Description

Deregisters the specified AMI. Once deregistered, the AMI cannot be used to launch new instances.

Note
This command does not delete the AMI.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>ImageId</td>
<td>The ID of the AMI to deregister. Type: String</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
</tbody>
</table>

Response Elements

The elements in the following table are wrapped in a DeregisterImageResponse element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request. Type: xsd:string</td>
</tr>
<tr>
<td>return</td>
<td>Returns true if the request succeeds. Otherwise, returns an error. Type: xsd:boolean</td>
</tr>

DescribeAddresses

Description

Describes one or more of the Elastic IP addresses allocated to your account.

This action applies to both EC2 and VPC Elastic IP addresses. For information about how these Elastic IP addresses differ, see Elastic IP Addresses in the Amazon Virtual Private Cloud User Guide.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>PublicIp.n</td>
<td>One or more EC2 Elastic IP addresses.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td>AllocationId.n</td>
<td>One or more allocation IDs corresponding to the address or addresses to describe (VPC addresses only).</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td>Filter.n.Name</td>
<td>The name of a filter. See the table in the Supported Filters section for a list of supported filter names.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td>Filter.n.Value.m</td>
<td>A value for the filter. See the table in the Supported Filters section for a list of supported values for each filter.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
</tbody>
</table>

Supported Filters

You can specify filters so that the response includes information for only certain Elastic IP addresses. For example, you can use a filter to specify that you're interested in addresses that have a specific tag. You can specify multiple values for a filter. The response includes information for an address only if it matches at least one of the filter values that you specified.

You can specify multiple filters; for example, specify addresses of a specific value that have a specific tag. The response includes information for an address only if it matches all the filters that you specified. If there's no match, no special message is returned, the response is simply empty.

You can use wildcards in a filter value. An asterisk (*) matches zero or more characters, and a question mark (?) matches exactly one character. You can escape special characters using a backslash (\) before the character. For example, a value of \*amazon?\ searches for the literal string *amazon?\.

The following table lists the available filters.
Filter Name | Description
---|---
domain | Indicates whether the address is a EC2 address, or a VPC address. Type: String
 | Valid values: `standard` | `vpc`
instance-id | The instance the address is associated with (if any). Type: String
public-ip | The Elastic IP address. Type: String
allocation-id | The allocation ID for the address (VPC addresses only). Type: String
association-id | The association ID for the address (VPC addresses only). Type: String
network-interface-id | The network interface (if any) that the address is associated with. (for VPC addresses only). Type: String
network-interface-owner-id | The owner IID.
private-ip-address | The private IP address associated with the Elastic IP address (for VPC addresses only). Type: String

**Response Elements**

The elements in the following table are wrapped in a `DescribeAddressesResponse` element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request. Type: <code>xsd:string</code></td>
</tr>
<tr>
<td>addressesSet</td>
<td>A list of IP addresses, each one wrapped in an <code>item</code> element. Type: <code>DescribeAddressesResponseItemType</code> (p. 451)</td>
</tr>
</tbody>
</table>

**Examples**

**Example Request**

EC2 addresses: This example describes two specific EC2 Elastic IP addresses assigned to the account. Amazon EC2 returns information about 192.0.2.1, which is assigned to instance i-f15ebb98, and for 198.51.100.2, which is not assigned to an instance.

https://ec2.amazonaws.com/?Action=DescribeAddresses &PublicIp.1=192.0.2.1
Example Response

```xml
<DescribeAddressesResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/"
  xmlns:xs="http://www.w3.org/2001/XMLSchema">
  <addressesSet>
    <item>
      <publicIp>192.0.2.1</publicIp>
      <domain>standard</domain>
      <instanceId>i-f15ebb98</instanceId>
    </item>
    <item>
      <publicIp>198.51.100.2</publicIp>
      <domain>standard</domain>
      <instanceId>i-f15ebb98</instanceId>
    </item>
  </addressesSet>
</DescribeAddressesResponse>
```

Example Request

VPC Addresses: This example describes a specific VPC address allocated to your account. You must use the allocation ID to specify the address.

https://ec2.amazonaws.com/?Action=DescribeAddresses
&AllocationId.1= eipalloc-08229861
&AUTHPARAMS

Example Response

```xml
<soap:Body>
  <DescribeAddressesResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/"
    xmlns:xs="http://www.w3.org/2001/XMLSchema">
    <addressesSet>
      <item>
        <publicIp>46.51.223.41</publicIp>
        <allocationId>eipalloc-08229861</allocationId>
        <domain>vpc</domain>
        <instanceId>i-64600030</instanceId>
        <associationId>eipassoc-f0229899</associationId>
        <networkInterfaceId>eni-ef229886</networkInterfaceId>
        <networkInterfaceOwnerId>053230519467</networkInterfaceOwnerId>
        <privateIpAddress>10.0.0.228</privateIpAddress>
      </item>
    </addressesSet>
  </DescribeAddressesResponse>
</soap:Body>
```
Example Request

VPC Addresses: This example lists only your VPC addresses (assuming you have both standard and VPC addresses).

https://ec2.amazonaws.com/?Action=DescribeAddresses
&Filter.1.Name=allocation-id
&Filter.1.Value.1=* &AUTHPARAMS

Example Response

<DescribeAddressesResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">

DescribeAvailabilityZones

Description

Describes one or more of the Availability Zones that are currently available to the account. The results include zones only for the region you're currently using.

Note

Availability Zones are not the same across accounts. The Availability Zone us-east-1a for account A is not necessarily the same as us-east-1a for account B. Zone assignments are mapped independently for each account.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>ZoneName.n</td>
<td>One or more Availability Zones.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td>Filter.n.Name</td>
<td>The name of a filter. See the table in the Supported Filters section for a list of supported filter names.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td>Filter.n.Value.m</td>
<td>A value for the filter. See the table in the Supported Filters section for a list of supported values for each filter.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
</tbody>
</table>

Supported Filters

You can specify filters so that the response includes information for only certain Availability Zones. For example, you can use a filter to specify that you're interested in Availability Zones in the available state. You can specify multiple values for a filter. The response includes information for an Availability Zone only if it matches at least one of the filter values that you specified.

You can specify multiple filters; for example, specify Availability Zones that are in a particular region and are in the available state. The response includes information for an Availability Zone only if it matches all the filters that you specified. If there's no match, no special message is returned, the response is simply empty.

You can use wildcards in a filter value. An asterisk (*) matches zero or more characters, and a question mark (?) matches exactly one character. You can escape special characters using a backslash (\) before the character. For example, a value of \*amazon\?\ searches for the literal string *amazon?\.

The following table lists the available filters.

<table>
<thead>
<tr>
<th>Filter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>message</td>
<td>Information about the Availability Zone.</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
</tr>
</tbody>
</table>
Filter Name | Description
--- | ---
region-name | The region the Availability Zone is in (for example, us-east-1). Type: String
state | The state of the Availability Zone Type: String Valid values: available
zone-name | The name of the zone. Type: String

**Response Elements**

The elements in the following table are wrapped in a `DescribeAvailabilityZonesResponse` element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request. Type: xsd:string</td>
</tr>
<tr>
<td>availabilityZoneInfo</td>
<td>A list of Availability Zones, each one wrapped in an <code>item</code> element. Type: AvailabilityZoneItemType (p. 442)</td>
</tr>
</tbody>
</table>

**Examples**

**Example Request**

This example displays information about Availability Zones that are available to the account. The results includes zones only in the region (endpoint) you’re currently using.

https://ec2.amazonaws.com/?Action=DescribeAvailabilityZones &AUTHPARAMS

**Example Response**

```xml
<DescribeAvailabilityZonesResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>

DescribeBundleTasks

Description

Describes one or more of your bundling tasks.

Note

Completed bundle tasks are listed for only a limited time. If your bundle task is no longer in the list, you can still register an AMI from it. Just use the RegisterImage action with the Amazon S3 bucket name and image manifest name you provided to the bundle task.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>BundleId.n</td>
<td>One or more bundle task IDs.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: If no ID is specified, all bundle tasks are described.</td>
<td></td>
</tr>
<tr>
<td>Filter.n.Name</td>
<td>The name of a filter. See the table in the Supported Filters section for a list of supported filter names.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td>Filter.n.Value.m</td>
<td>A value for the filter. See the table in the Supported Filters section for a list of supported values for each filter.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
</tbody>
</table>

Supported Filters

You can specify filters so that the response includes information for only certain bundle tasks. For example, you can use a filter to specify that you’re interested in the bundle tasks in the complete state. You can specify multiple values for a filter. The response includes information for a bundle task only if it matches at least one of the filter values that you specified.

You can specify multiple filters; for example, specify bundles that are stored in a specific Amazon S3 bucket and are in the complete state. The response includes information for a bundle task only if it matches all the filters that you specified. If there’s no match, no special message is returned, the response is simply empty.

You can use wildcards in a filter value. An asterisk (*) matches zero or more characters, and a question mark (?) matches exactly one character. You can escape special characters using a backslash (\) before the character. For example, a value of "*amazon?\" searches for the literal string *amazon?\.

The following table lists the available filters.

<table>
<thead>
<tr>
<th>Filter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bundle-id</td>
<td>The ID of the bundle task.</td>
</tr>
<tr>
<td>Filter Name</td>
<td>Description</td>
</tr>
<tr>
<td>----------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>error-code</td>
<td>If the task failed, the error code returned. Type: String</td>
</tr>
<tr>
<td>error-message</td>
<td>If the task failed, the error message returned. Type: String</td>
</tr>
<tr>
<td>instance-id</td>
<td>The ID of the instance that was bundled. Type: String</td>
</tr>
<tr>
<td>progress</td>
<td>The level of task completion, as a percentage (for example, 20%). Type: String</td>
</tr>
<tr>
<td>s3-bucket</td>
<td>The Amazon S3 bucket to store the AMI. Type: String</td>
</tr>
<tr>
<td>s3-prefix</td>
<td>The beginning of the AMI name. Type: String</td>
</tr>
<tr>
<td>start-time</td>
<td>The time the task started (for example, 2008-09-15T17:15:20.000Z). Type: DateTime</td>
</tr>
</tbody>
</table>
| state          | The state of the task. Type: String
|                | Valid values: pending | waiting-for-shutdown | bundling | storing
|                |                        | cancelling | complete | failed       |
| update-time    | The time of the most recent update for the task (for example, 2008-09-15T17:15:20.000Z). Type: DateTime |

### Response Elements

The elements in the following table are wrapped in a `DescribeBundleTasksResponse` element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request. Type: xsd:string</td>
</tr>
<tr>
<td>bundleInstanceTasksSet</td>
<td>A list of bundle tasks, each one wrapped in an <code>item</code> element. Type: <code>BundleInstanceTaskType</code> (p. 447)</td>
</tr>
</tbody>
</table>

### Examples

#### Example Request

This example describes the status of the `bun-57a5403e` bundle task.
Example Response

```xml
<DescribeBundleTasksResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <bundleInstanceTasksSet>
    <item>
      <instanceId>i-12345678</instanceId>
      <bundleId>bun-c1a540a8</bundleId>
      <state>cancelling</state>
      <startTime>2008-10-07T11:41:50.000Z</startTime>
      <updateTime>2008-10-07T11:51:50.000Z</updateTime>
      <storage>
        <S3>
          <bucket>myawsbucket</bucket>
          <prefix>winami</prefix>
        </S3>
      </storage>
      <progress>20%</progress>
    </item>
  </bundleInstanceTasksSet>
</DescribeBundleTasksResponse>
```

Example Request

This example filters the response to include only bundle tasks whose state is either complete or failed, and in addition are targeted for the Amazon S3 bucket called myawsbucket.

```plaintext
https://ec2.amazonaws.com/?Action=DescribeBundleTasks
&bundleId.1=bun-c1a540a8
&Filter.1.Name=s3-bucket
&Filter.1.Value.1=myawsbucket
&Filter.2.Name=state
&Filter.2.Name.1=complete
&Filter.2.Name.2=failed
&AUTHPARAMS
```

DescribeConversionTasks

Description

Describes one or more of your conversion tasks. For more information, see Using the Command Line Tools to Import Your Virtual Machine to Amazon EC2 in the Amazon Elastic Compute Cloud User Guide.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>ConversionTaskId.n</td>
<td>One or more conversion task IDs. Type: String</td>
<td>No</td>
</tr>
</tbody>
</table>

Response Elements

The elements in the following table are wrapped in a DescribeConversionTasksResponse element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>conversionTasks</td>
<td>A list of conversion tasks, each one wrapped in an item element. Type: ConversionTaskType (p. 448)</td>
</tr>
</tbody>
</table>

Examples

Example Request

This example describes all your conversion tasks.

https://ec2.amazonaws.com/?Action=DescribeConversionTasks &AUTHPARAMS

Example Response

```xml
<DescribeConversionTasksResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
  <conversionTasks>
    <item>
      <conversionTask>
        <conversionTaskId>import-i-fh95npoc</conversionTaskId>
        <expirationTime>2010-12-22T12:01Z</expirationTime>
        <importVolume>
          <bytesConverted>1000</bytesConverted>
          <availabilityZone>us-east-1a</availabilityZone>
        </importVolume>
        <description/>
        <image>
          <format>VDMK</format>
          <size>128696320</size>
        </image>
      </conversionTask>
    </item>
  </conversionTasks>
</DescribeConversionTasksResponse>
```

DescribeCustomerGateways

Description

Describes one or more of your VPN customer gateways.

For more information about Amazon Virtual Private Cloud and VPN customer gateways, see Adding an IPsec Hardware Virtual Private Gateway to Your VPC in the Amazon Virtual Private Cloud User Guide.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>CustomerGatewayId.n</td>
<td>A customer gateway ID. You can specify more than one in the request.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: Describes your customer gateways.</td>
<td></td>
</tr>
<tr>
<td>Filter.n.Name</td>
<td>The name of a filter. See the table in the Supported Filters section for a list of supported filter names.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td>Filter.n.Value.m</td>
<td>A value for the filter. See the table in the Supported Filters section for a list of supported values for each filter.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
</tbody>
</table>

Supported Filters

You can specify filters so that the response includes information for only certain customer gateways. For example, you can use a filter to specify that you're interested in customer gateways in the pending or available state. You can specify multiple values for a filter. The response includes information for a customer gateway only if it matches at least one of the of the filter values that you specified.

You can specify multiple filters; for example, specify customer gateways that have a specific IP address for the Internet-routable external interface and are in the pending or available state. The response includes information for a customer gateway only if it matches all the filters that you specified. If there's no match, no special message is returned, the response is simply empty.

You can use wildcards in a filter value. An asterisk (*) matches zero or more characters, and a question mark (?) matches exactly one character. You can escape special characters using a backslash (\) before the character. For example, a value of "*amazon?\" searches for the literal string *amazon?\.

The following table lists the available filters.

<table>
<thead>
<tr>
<th>Filter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bgp-asn</td>
<td>The customer gateway's Border Gateway Protocol (BGP) Autonomous System Number (ASN).</td>
</tr>
</tbody>
</table>
Filter Name | Description |
---|---|
`customer-gateway-id` | The ID of the customer gateway. Type: String |
`ip-address` | The IP address of the customer gateway's Internet-routable external interface (for example, 12.1.2.3). Type: String |
`state` | The state of the customer gateway. Type: String Valid values: pending | available | deleting | deleted |
`type` | The type of customer gateway. Currently the only supported type is `ipsec.1`. Type: String Valid values: `ipsec.1` |
`tag-key` | The key of a tag assigned to the resource. This filter is independent of the `tag-value` filter. For example, if you use both the filter "tag-key=Purpose" and the filter "tag-value=X", you get any resources assigned both the tag key `Purpose` (regardless of what the tag's value is), and the tag value `X` (regardless of what the tag's key is). If you want to list only resources where `Purpose` is `X`, see the `tag: key` filter later in this table. For more information about tags, see Tagging Your Resources in the Amazon Elastic Compute Cloud User Guide. Type: String |
`tag-value` | The value of a tag assigned to the resource. This filter is independent of the `tag-key` filter. Type: String |
`tag: key` | Filters the response based on a specific tag/value combination. Example: To list just the resources that have been assigned tag `Purpose=X`, specify: Filter.1.Name=tag:Purpose Filter.1.Value.1=X Example: To list just resources that have been assigned tag `Purpose=X OR Purpose=Y`, specify: Filter.1.Name=tag:Purpose Filter.1.Value.1=X Filter.1.Value.2=Y |

**Response Elements**

The elements in the following table are wrapped in an `DescribeCustomerGatewaysResponse` element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>requestId</code></td>
<td>The ID of the request. Type: xsd:string</td>
</tr>
</tbody>
</table>
### Examples

#### Example Request

This example gives a description of the customer gateway with ID cgw-b4dc3961.

```
https://ec2.amazonaws.com/?Action=DescribeCustomerGateways
&CustomerGatewayId.1=.cgw-b4dc3961
&AUTHPARAMS
```

#### Example Response

```
<DescribeCustomerGatewaysResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
  <requestId>7a62c49f-347e-4fc4-9331-6e8eEXAMPLE</requestId>
  <customerGatewaySet>
    <item>
      <customerGatewayId>cgw-b4dc3961</customerGatewayId>
      <state>available</state>
      <type>ipsec.1</type>
      <ipAddress>12.1.2.3</ipAddress>
      <bgpAsn>65534</bgpAsn>
      <tagSet/>
    </item>
  </customerGatewaySet>
</DescribeCustomerGatewaysResponse>
```

#### Example Request

This example uses filters to give a description of any customer gateway you own whose IP address is 12.1.2.3, and whose state is either pending or available.

```
https://ec2.amazonaws.com/?Action=DescribeCustomerGateways
&Filter.1.Name=ip-address
&Filter.1.Value.1=12.1.2.3
&Filter.2.Name=state
&Filter.2.Value.1=pending
&Filter.2.Value.2=available
&AUTHPARAMS
```

DescribeDhcpOptions

Description

Describes one or more of your sets of DHCP options.

For more information about Amazon Virtual Private Cloud and DHCP options sets, see Using DHCP Options in Your VPC in the Amazon Virtual Private Cloud User Guide.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>DhcpOptionsId.n</td>
<td>A DHCP options set ID. You can specify more than one in the request.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: Describes your sets of DHCP options, or only those otherwise specified.</td>
<td></td>
</tr>
<tr>
<td>Filter.n.Name</td>
<td>The name of a filter. See the table in the Supported Filters section for a list of supported filter names.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td>Filter.n.Value.m</td>
<td>A value for the filter. See the table in the Supported Filters section for a list of supported values for each filter.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
</tbody>
</table>

Supported Filters

You can specify filters so that the response includes information for only certain sets of DHCP options. For example, you can use a filter to specify that you're interested in sets of DHCP options with a particular value for the domain-name option. You can specify multiple values for a filter. The response includes information for a set of DHCP options only if it matches at least one of the filter values that you specified.

You can specify multiple filters; for example, specify sets of DHCP options that have a specific value for the domain-name option and a specific tag. The response includes information for a set of DHCP options only if it matches all the filters that you specified. If there's no match, no special message is returned, the response is simply empty.

You can use wildcards in a filter value. An asterisk (*) matches zero or more characters, and a question mark (?) matches exactly one character. You can escape special characters using a backslash (\) before the character. For example, a value of "*amazon\?\\ searches for the literal string *amazon?\.

The following table lists the available filters.

<table>
<thead>
<tr>
<th>Filter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dhcp-options-id</td>
<td>The ID of a set of DHCP options.</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
</tr>
<tr>
<td>Filter Name</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>-------------</td>
</tr>
<tr>
<td>key</td>
<td>The key for one of the options (for example, domain-name). Type: String</td>
</tr>
<tr>
<td>value</td>
<td>The value for one of the options. Type: String</td>
</tr>
<tr>
<td>tag-key</td>
<td>The key of a tag assigned to the resource. This filter is independent of the tag-value filter. For example, if you use both the filter &quot;tag-key=Purpose&quot; and the filter &quot;tag-value=X&quot;, you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the tag: key filter later in this table. For more information about tags, see Tagging Your Resources in the Amazon Elastic Compute Cloud User Guide. Type: String</td>
</tr>
<tr>
<td>tag-value</td>
<td>The value of a tag assigned to the resource. This filter is independent of the tag-key filter. Type: String</td>
</tr>
<tr>
<td>tag: key</td>
<td>Filters the response based on a specific tag/value combination. Example: To list just the resources that have been assigned tag Purpose=X, specify: Filter.1.Name=tag:Purpose Filter.1.Value.1=X Example: To list just resources that have been assigned tag Purpose=X OR Purpose=Y, specify: Filter.1.Name=tag:Purpose Filter.1.Value.1=X Filter.1.Value.2=Y</td>
</tr>
</tbody>
</table>

## Response Elements

The elements in the following table are wrapped in a DescribeDhcpOptionsResponse element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request. Type: xsd:string</td>

Describe Image Attribute

Description

Describes an attributes of an AMI. You can specify only one attribute at a time. These are the available attributes:

- **description**—Description of the AMI provided at image creation
- **kernel**—ID of the kernel associated with the AMI
- **ramdisk**—ID of the RAM disk associated with the AMI
- **launchPermission**—Launch permissions for the AMI
- **productCodes**—Product codes associated with the AMI (if any). Each product code contains a product code and a type.
- **blockDeviceMapping**—Block device mapping of the AMI

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>ImageId</td>
<td>The ID of the AMI. Type: String Default: None</td>
<td>Yes</td>

   </productCodes>
</DescribeImageAttributeResponse>
```

Related Operations

- `DescribeImages` (p. 186)
- `ModifyImageAttribute` (p. 357)
- `ResetImageAttribute` (p. 403)
DescribeImages

Description

Describes the images (AMIs, AKIs, and ARIs) available to you. Images available to you include public images, private images that you own, and private images owned by other AWS accounts but for which you have explicit launch permissions.

Launch permissions fall into three categories:

<table>
<thead>
<tr>
<th>Launch Permission</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>public</td>
<td>The owner of the AMI granted launch permissions for the AMI to the all group. All AWS accounts have launch permissions for these AMIs.</td>
</tr>
<tr>
<td>explicit</td>
<td>The owner of the AMI granted launch permissions to a specific AWS account.</td>
</tr>
<tr>
<td>implicit</td>
<td>An AWS account has implicit launch permissions for all the AMIs it owns.</td>
</tr>
</tbody>
</table>

The list of AMIs returned can be modified by specifying AMI IDs, AMI owners, or AWS accounts with launch permissions. If no options are specified, Amazon EC2 returns all AMIs for which you have launch permissions.

If you specify one or more AMI IDs, only AMIs that have the specified IDs are returned. If you specify an invalid AMI ID, an error is returned. If you specify an AMI ID for which you do not have access, it will not be included in the returned results.

If you specify one or more AMI owners, only AMIs from the specified owners and for which you have access are returned. The results can include the account IDs of the specified owners—amazon for AMIs owned by Amazon or self, for AMIs that you own, or marketplace for AMIs from the AWS Marketplace.

Note
For an overview of the AWS Marketplace, go to https://aws.amazon.com/marketplace/help/200900000. For details on how to use the AWS Marketplace, see AWS Marketplace.

If you specify a list users with launch permissions, only AMIs with launch permissions for those users are returned. You can specify account IDs (if you own the AMI(s)), self for AMIs for which you own or have explicit permissions, or all for public AMIs.

Note
Deregistered images are included in the returned results for an unspecified interval after deregistration.
Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
</table>
| ExecutableBy.n     | The AMIs for which the specified user ID has explicit launch permissions. The user ID can be an AWS account ID, self to return AMIs for which the sender of the request has explicit launch permissions, or all to return AMIs with public launch permissions. Type: String
Default: None      | No       |
| ImageId.n          | One or more AMI IDs. Type: String
Default: Returns all AMIs, or only those otherwise specified.                   | No       |
| Owner.n            | The AMIs owned by the specified owner. Multiple owner values can be specified. The IDs amazon, aws-marketplace, and self can be used to include AMIs owned by Amazon, AWS Marketplace, or AMIs owned by you, respectively.
Type: String
Default: None
Valid values: amazon | No       |
|                    | aws-marketplace | self | AWS account ID | all |
| Filter.n.Name      | The name of a filter. See the table in the Supported Filters section for a list of supported filter names. Type: String
Default: None      | No       |
| Filter.n.Value.m   | A value for the filter. See the table in the Supported Filters section for a list of supported values for each filter.
Type: String
Default: None      | No       |

Supported Filters

You can specify filters so that the response includes information for only certain images. For example, you can use a filter to specify that you're interested in images that use a specific kernel. You can specify multiple values for a filter. The response includes information for an image only if it matches at least one of the filter values that you specified.

You can specify multiple filters; for example, specify images that use a specific kernel and use an Amazon EBS volume as the root device. The response includes information for an image only if it matches all the filters that you specified. If there's no match, no special message is returned, the response is simply empty.

You can use wildcards in a filter value. An asterisk (*) matches zero or more characters, and a question mark (?) matches exactly one character. You can escape special characters using a backslash (\) before the character. For example, a value of \*amazon?\ searches for the literal string *amazon?\.
The following table lists the available filters.

<table>
<thead>
<tr>
<th>Filter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>architecture</td>
<td>The image architecture. Type: String  Valid values: i386</td>
</tr>
<tr>
<td>block-device-mapping.delete-on-termination</td>
<td>Whether the Amazon EBS volume is deleted on instance termination. Type: Boolean</td>
</tr>
<tr>
<td>block-device-mapping.device-name</td>
<td>The device name (for example, /dev/sdh) for the Amazon EBS volume. Type: String</td>
</tr>
<tr>
<td>block-device-mapping.snapshot-id</td>
<td>The ID of the snapshot used for the Amazon EBS volume. Type: String</td>
</tr>
<tr>
<td>block-device-mapping.volume-size</td>
<td>The volume size of the Amazon EBS volume, in GiB. Type: Integer</td>
</tr>
<tr>
<td>block-device-mapping.volume-type</td>
<td>The volume type of the Amazon EBS volume. Type: String  Valid values: standard</td>
</tr>
<tr>
<td>description</td>
<td>The description of the image (provided during image creation). Type: String</td>
</tr>
<tr>
<td>image-id</td>
<td>The ID of the image. Type: String</td>
</tr>
<tr>
<td>image-type</td>
<td>The image type. Type: String  Valid values: machine</td>
</tr>
<tr>
<td>is-public</td>
<td>Whether the image is public. Type: Boolean</td>
</tr>
<tr>
<td>kernel-id</td>
<td>The kernel ID. Type: String</td>
</tr>
<tr>
<td>manifest-location</td>
<td>The location of the image manifest. Type: String</td>
</tr>
<tr>
<td>name</td>
<td>The name of the AMI (provided during image creation). Type: String</td>
</tr>
<tr>
<td>owner-alias</td>
<td>The AWS account alias (for example, amazon). Type: String</td>
</tr>
<tr>
<td>Filter Name</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>owner-id</td>
<td>The AWS account ID of the image owner. Type: String</td>
</tr>
<tr>
<td>platform</td>
<td>The platform. To only list Windows-based AMIs, use windows. Otherwise, leave blank. Type: String Valid value: windows</td>
</tr>
<tr>
<td>product-code</td>
<td>The product code. Type: String</td>
</tr>
<tr>
<td>product-code.type</td>
<td>The type of the product code. Type: String Valid values: devpay</td>
</tr>
<tr>
<td>ramdisk-id</td>
<td>The RAM disk ID. Type: String</td>
</tr>
<tr>
<td>root-device-name</td>
<td>The name of the root device volume (for example, /dev/sda1). Type: String</td>
</tr>
<tr>
<td>root-device-type</td>
<td>The type of the root device volume. Type: String Valid values: ebs</td>
</tr>
<tr>
<td>state</td>
<td>The state of the image. Type: String Valid values: available</td>
</tr>
<tr>
<td>state-reason-code</td>
<td>The reason code for the state change. Type: String</td>
</tr>
<tr>
<td>state-reason-message</td>
<td>The message for the state change. Type: String</td>
</tr>
<tr>
<td>tag-key</td>
<td>The key of a tag assigned to the resource. This filter is independent of the tag-value filter. For example, if you use both the filter &quot;tag-key=Purpose&quot; and the filter &quot;tag-value=x&quot;, you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value x (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the tag: key filter later in this table. For more information about tags, see Tagging Your Resources in the Amazon Elastic Compute Cloud User Guide. Type: String</td>
</tr>
</tbody>
</table>
### Response Elements

The elements in the following table are wrapped in a `DescribeImagesResponse` element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request.</td>
</tr>
<tr>
<td>imagesSet</td>
<td>A list of images, each one wrapped in an <code>item</code> element.</td>
</tr>
</tbody>
</table>

#### Examples

**Example Request**

This example describes the ami-be3adfd7 AMI.

```plaintext
https://ec2.amazonaws.com/?Action=DescribeImages
&ImageId.1=ami-be3adfd7
&AUTHPARAMS
```
Example Response

```xml
<DescribeImagesResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <imagesSet>
    <item>
      <imageId>ami-be3adfd7</imageId>
      <imageLocation>amazon/getting-started</imageLocation>
      <imageState>available</imageState>
      <imageOwnerId>206029621532</imageOwnerId>
      <isPublic>true</isPublic>
      <architecture>i386</architecture>
      <imageType>machine</imageType>
      <kernelId>aki-d3376696</kernelId>
      <ramdiskId>ari-e73766a2</ramdiskId>
      <imageOwnerAlias>amazon</imageOwnerAlias>
      <name>getting-started</name>
      <description>Fedora 8 v1.11 i386 lvm-rootVG-rootFS ext3 ec2pnp enabled</description>
      <rootDeviceType>ebs</rootDeviceType>
      <rootDeviceName>/dev/sda</rootDeviceName>
      <blockDeviceMapping>
        <item>
          <deviceName>/dev/sda1</deviceName>
          <ebs>
            <snapshotId>snap-32885f5a</snapshotId>
            <volumeSize>15</volumeSize>
            <deleteOnTermination>false</deleteOnTermination>
            <volumeType>standard</volumeType>
          </ebs>
        </item>
      </blockDeviceMapping>
      <virtualizationType>paravirtual</virtualizationType>
      <tagSet/>
      <hypervisor>xen</hypervisor>
    </item>
  </imagesSet>
</DescribeImagesResponse>
```

Example Request

This example filters the response to include only the public Windows images with an x86_64 architecture.

```
https://ec2.amazonaws.com/?Action=DescribeImages
&Filter.1.Name=is-public
&Filter.1.Value.1=true
&Filter.2.Name=architecture
&Filter.2.Value.1=x86_64
&Filter.3.Name=platform
&Filter.3.Value.1=windows
&AUTHPARAMS
```
Example Response

<DescribeImagesResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <imagesSet>
    <item>
      <imageId>ami-dd20c3b4</imageId>
      <imageLocation>ec2-public-windows-images/Server2003r2-x86_64-Win-v1.07.manifest.xml</imageLocation>
      <imageState>available</imageState>
      <imageOwnerId>206029621532</imageOwnerId>
      <isPublic>true</isPublic>
      <architecture>x86_64</architecture>
      <imageType>machine</imageType>
      <platform>windows</platform>
      <imageOwnerAlias>amazon</imageOwnerAlias>
      <rootDeviceType>instance-store</rootDeviceType>

Related Operations

- DescribeInstances (p. 197)
- DescribeImageAttribute (p. 183)
DescribeInstanceAttribute

Description

Describes an attribute of the specified instance. You can specify only one attribute at a time. These are the available attributes:

- **instanceType**—The instance type (for example, m1.small)
- **kernel**—The ID of the kernel associated with the instance
- **ramdisk**—The ID of the RAM disk associated with the instance
- **userData**—MIME, Base64-encoded user data provided to the instance
- **disableApiTermination**—Whether the instance can be terminated using the Amazon EC2 API (false means the instance can be terminated with the API)
- **instanceInitiatedShutdownBehavior**—Whether the instance stops or terminates when an instance shutdown is initiated (default is stop)
- **rootDeviceName**—The name of the root device volume.
- **blockDeviceMapping**—The block device mapping.
- **sourceDestCheck**—This attribute exists to enable a Network Address Translation (NAT) instance in a VPC to perform NAT. The attribute controls whether source/destination checking is enabled on the instance. A value of true means checking is enabled. The value must be false for the instance to perform NAT.
- **groupSet**—The security groups the instance belongs to.
- **productCodes**—The product codes associated with the instance. Each product code contains a product code and a type.
- **ebsOptimized**—Whether the instance is optimized for EBS I/O.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>InstanceId</td>
<td>The instance ID. Type: String Default: None</td>
<td>Yes</td>
</tr>
<tr>
<td>Attribute</td>
<td>The instance attribute. Type: String Default: None</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Valid values: instanceType</td>
<td>kernel</td>
</tr>
</tbody>
</table>

Response Elements

The elements in the following table are wrapped in a `DescribeInstanceAttributeResponse` element.
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request. Type: xsd:string</td>
</tr>
<tr>
<td>instanceId</td>
<td>The ID of the instance. Type: xsd:string</td>
</tr>
<tr>
<td>instanceType</td>
<td>The instance type (for example, m1.small), wrapped in a value element. Type: xsd:string</td>
</tr>
<tr>
<td>kernel</td>
<td>The kernel ID, wrapped in a value element. Type: xsd:string</td>
</tr>
<tr>
<td>ramdisk</td>
<td>The RAM disk ID, wrapped in a value element. Type: xsd:string</td>
</tr>
<tr>
<td>userData</td>
<td>MIME, Base64-encoded user data, wrapped in a value element. Type: xsd:string</td>
</tr>
<tr>
<td>disableApiTermination</td>
<td>Indicates whether the instance can be terminated through the Amazon EC2 API. The value is wrapped in a value element. A value of true means you can't terminate the instance using the API (i.e., the instance is &quot;locked&quot;); a value of false means you can. You must modify this attribute before you can terminate any &quot;locked&quot; instances using the API. Type: xsd:boolean</td>
</tr>
<tr>
<td>instanceInitiatedShutdownBehavior</td>
<td>If an instance shutdown is initiated, this determines whether the instance stops or terminates. The value is wrapped in a value element. Type: xsd:string  Valid values: stop</td>
</tr>
<tr>
<td>rootDeviceName</td>
<td>The name of the root device (for example, /dev/sda1), wrapped in a value element. Type: xsd:string</td>
</tr>
<tr>
<td>blockDeviceMapping</td>
<td>Any block device mapping entries for the instance, each one wrapped in an item element. Type: InstanceBlockDeviceMappingResponseItemType (p. 474)</td>
</tr>
<tr>
<td>sourceDestCheck</td>
<td>This attribute exists to enable a Network Address Translation (NAT) instance in a VPC to perform NAT. The attribute controls whether source/destination checking is enabled on the instance. A value of true means checking is enabled, and false means checking is disabled. The value must be false for the instance to perform NAT. For more information, see NAT Instances in the Amazon Virtual Private Cloud User Guide. Type: xsd:boolean</td>
</tr>
<tr>
<td>groupSet</td>
<td>The security groups the instance belongs to. Each group's information is wrapped in an item element. Type: GroupItemType (p. 469)</td>
</tr>
</tbody>
</table>
### Examples

#### Example Request

This example lists the kernel ID of the i-10a64379 instance.

```
https://ec2.amazonaws.com/?Action=DescribeInstanceAttribute
&InstanceId=i-10a64379
&Attribute=kernel
&AUTHPARAMS
```

#### Example Response

```
<DescribeInstanceAttributeResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <instanceId>i-10a64379</instanceId>
  <kernel>
    <value>aki-f70657b2</value>
  </kernel>
</DescribeInstanceAttributeResponse>
```

- [ResetInstanceAttribute](p. 405)
DescribeInstances

Description

Describes one or more of your instances.

If you specify one or more instance IDs, Amazon EC2 returns information for those instances. If you do not specify instance IDs, Amazon EC2 returns information for all relevant instances. If you specify an invalid instance ID, an error is returned. If you specify an instance that you do not own, it is not included in the returned results.

Recently terminated instances might appear in the returned results. This interval is usually less than one hour.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>InstanceId.n</td>
<td>One or more instance IDs. Type: String Default: Returns all instances, or only those otherwise specified.</td>
<td>No</td>
</tr>
<tr>
<td>Filter.n.Name</td>
<td>The name of a filter. See the table in the Supported Filters section for a list of supported filter names. Type: String Default: None</td>
<td>No</td>
</tr>
<tr>
<td>Filter.n.Value.m</td>
<td>A value for the filter. See the table in the Supported Filters section for a list of supported values for each filter. Type: String Default: None</td>
<td>No</td>
</tr>
</tbody>
</table>

Supported Filters

You can specify filters so that the response includes information for only certain instances. For example, you can use a filter to specify that you're interested in instances launched with a specific key pair. You can specify multiple values for a filter. The response includes information for an instance only if it matches at least one of the filter values that you specified.

You can specify multiple filters; for example, specify instances that are launched with a specific key pair and use an Amazon EBS volume as the root device. The response includes information for an instance only if it matches all the filters that you specified. If there's no match, no special message is returned, the response is simply empty.

You can use wildcards in a filter value. An asterisk (*) matches zero or more characters, and a question mark (?) matches exactly one character. You can escape special characters using a backslash (\) before the character. For example, a value of "*amazon\?\" searches for the literal string "*amazon?\".

The following table lists the available filters.
<table>
<thead>
<tr>
<th>Filter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>architecture</td>
<td>The instance architecture.</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
</tr>
<tr>
<td></td>
<td>Valid values: i386</td>
</tr>
<tr>
<td>availability-zone</td>
<td>The Availability Zone of the instance.</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
</tr>
<tr>
<td>block-device-mapping.attach-time</td>
<td>The attach time for an Amazon EBS volume mapped</td>
</tr>
<tr>
<td></td>
<td>to the instance (for example, 2010-09-15T17:15:20.000Z)</td>
</tr>
<tr>
<td></td>
<td>Type: DateTime</td>
</tr>
<tr>
<td>block-device-mapping.delete-on-termination</td>
<td>Whether the Amazon EBS volume is deleted on instance termination.</td>
</tr>
<tr>
<td></td>
<td>Type: Boolean</td>
</tr>
<tr>
<td>block-device-mapping.device-name</td>
<td>The device name (for example, /dev/sdh) for the Amazon EBS volume.</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
</tr>
<tr>
<td>block-device-mapping.status</td>
<td>The status for the Amazon EBS volume.</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
</tr>
<tr>
<td></td>
<td>Valid values: attaching</td>
</tr>
<tr>
<td>block-device-mapping.volume-id</td>
<td>The volume ID of the Amazon EBS volume.</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
</tr>
<tr>
<td>client-token</td>
<td>The idempotency token you provided when you launched the instance.</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
</tr>
<tr>
<td>dns-name</td>
<td>The public DNS name of the instance.</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
</tr>
<tr>
<td>group-id</td>
<td>The ID of a EC2 security group the instance is in. This filter does not work for VPC security groups (instead, use instance.group-id).</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
</tr>
<tr>
<td>group-name</td>
<td>The name of a EC2 security group the instance is in. This filter does not work for VPC security groups (instead, use instance.group-name).</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
</tr>
<tr>
<td>image-id</td>
<td>The ID of the image used to launch the instance.</td>

<td></td>
<td>Type: String</td>
</tr>
<tr>
<td>Filter Name</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>reservation-id</td>
<td>The ID of the instance’s reservation. A reservation ID is created any time you launch an instance. A reservation ID has a one-to-one relationship with an instance launch request, but can be associated with more than one instance if you launch multiple instances using the same launch request. For example, if you launch one instance, you’ll get one reservation ID. If you launch ten instances using the same launch request, you’ll also get one reservation ID. Type: String</td>
</tr>
<tr>
<td>root-device-name</td>
<td>The name of the root device for the instance (for example, /dev/sda1). Type: String</td>
</tr>
<tr>
<td>root-device-type</td>
<td>The type of root device the instance uses. Type: String</td>
</tr>
<tr>
<td></td>
<td>Valid values: ebs</td>
</tr>
<tr>
<td>source-dest-check</td>
<td>Indicates whether the instance performs source/destination checking. A value of true means checking is enabled, and false means checking is disabled. The value must be false for the instance to perform Network Address Translation (NAT) in your VPC. Type: Boolean</td>
</tr>
<tr>
<td>spot-instance-request-id</td>
<td>The ID of the Spot Instance request. Type: String</td>
</tr>
<tr>
<td>state-reason-code</td>
<td>The reason code for the state change. Type: String</td>
</tr>
<tr>
<td>state-reason-message</td>
<td>A message that describes the state change. Type: String</td>
</tr>
<tr>
<td>subnet-id</td>
<td>The ID of the subnet the instance is in (if using Amazon Virtual Private Cloud). Type: String</td>

<tr>
<td>tag-key</td>
<td>The key of a tag assigned to the resource. This filter is independent of the tag-value filter. For example, if you use both the filter &quot;tag-key=Purpose&quot; and the filter &quot;tag-value=X&quot;, you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the tag: key filter later in this table. For more information about tags, see Tagging Your Resources in the Amazon Elastic Compute Cloud User Guide. Type: String</td>
</tr>
<tr>
<td>tag-value</td>
<td>The value of a tag assigned to the resource. This filter is independent of the tag-key filter.</td>
</tr>
<tr>
<td>tag: key</td>
<td>Filters the response based on a specific tag/value combination. Example: To list just the resources that have been assigned tag Purpose=X, specify: Filter.1.Name=tag:Purpose Filter.1.Value.1=X Example: To list just resources that have been assigned tag Purpose=X OR Purpose=Y, specify: Filter.1.Name=tag:Purpose Filter.1.Value.1=X Filter.1.Value.2=Y</td>
</tr>
<tr>
<td>virtualization-type</td>
<td>The virtualization type of the instance. Type: String Valid values: paravirtual</td>
</tr>
<tr>
<td>vpc-id</td>
<td>The ID of the VPC the instance is in (if using Amazon Virtual Private Cloud). Type: String</td>
</tr>
<tr>
<td>hypervisor</td>
<td>The hypervisor type of the instance. Type: String Valid values: ovm</td>
</tr>
<tr>
<td>network-interface.description</td>
<td>The description of the network interface (available only in Amazon Virtual Private Cloud). Type: String</td>
</tr>
<tr>
<td>network-interface.subnet-id</td>
<td>The ID of the subnet of the network interface (available only in Amazon Virtual Private Cloud). Type: String</td>
</tr>
<tr>
<td>Filter Name</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>network-interface.vpc-id</td>
<td>The ID of the Amazon VPC of the network interface. (available only in Amazon Virtual Private Cloud). Type: String</td>
</tr>
<tr>
<td>network-interface.network-interface.id</td>
<td>The ID of the network interface (available only in Amazon Virtual Private Cloud). Type: String</td>
</tr>
<tr>
<td>network-interface.owner-id</td>
<td>The ID of the owner of the network interface. (available only in Amazon Virtual Private Cloud). Type: String</td>
</tr>
<tr>
<td>network-interface.availability-zone</td>
<td>The availability zone of the network interface. (available only in Amazon Virtual Private Cloud). Type: String</td>
</tr>
<tr>
<td>network-interface.requester-id</td>
<td>The requester ID of the network interface. (available only in Amazon Virtual Private Cloud). Type: String</td>
</tr>
<tr>
<td>network-interface.requester-managed</td>
<td>Indicates whether the network interface is being managed by an AWS service (for example, AWS Management Console, Auto Scaling, and so on). This filter is available only in Amazon Virtual Private Cloud. Type: Boolean</td>
</tr>
<tr>
<td>network-interface.status</td>
<td>The status of the network interface. (available only in Amazon Virtual Private Cloud). Type: String Valid values: available</td>
</tr>
<tr>
<td>network-interface.mac-address</td>
<td>The MAC address of the network interface. (available only in Amazon Virtual Private Cloud). Type: String Valid values: available</td>
</tr>
<tr>
<td>network-interface-private-dns-name</td>
<td>The private DNS name of the network interface. (available only in Amazon Virtual Private Cloud). Type: String</td>
</tr>
<tr>
<td>network-interface.source-destination-check</td>
<td>Whether the network interface performs source/destination checking. A value of true means checking is enabled, and false means checking is disabled. The value must be false for the network interface to perform Network Address Translation (NAT) in your VPC. (available only in Amazon Virtual Private Cloud). Type: Boolean</td>
</tr>
<tr>
<td>Filter Name</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>-------------</td>
</tr>
<tr>
<td>network-interface.group-id</td>
<td>The ID of a VPC security group associated with the network interface (available only in Amazon Virtual Private Cloud). Type: String</td>
</tr>
<tr>
<td>network-interface.group-name</td>
<td>The name of a VPC security group associated with the network interface (available only in Amazon Virtual Private Cloud). Type: String</td>

<td>network-interface.addresses.private-ip-address</td>
<td>The private IP address associated with the network interface (available only in Amazon Virtual Private Cloud). Type: String</td>
</tr>
<tr>
<td>network-interface.attachment.device-index</td>
<td>The device index to which the network interface is attached (available only in Amazon Virtual Private Cloud). Type: Integer</td>
</tr>
<tr>
<td>network-interface.attachment.status</td>
<td>The status of the attachment. (available only in Amazon Virtual Private Cloud). Type: String Valid values: attaching</td>
</tr>
<tr>
<td>network-interface.attachment.attach-time</td>
<td>The time that the network interface was attached to an instance (available only in Amazon Virtual Private Cloud). Type: Date</td>
</tr>
<tr>
<td>network-interface.attachment.delete-on-termination</td>
<td>Specifies whether the attachment is deleted when an instance is terminated (available only in Amazon Virtual Private Cloud). Type: Boolean</td>
</tr>
</tbody>
</table>
Filter Name | Description
--- | ---
`network-interface.addresses.primary` | Specifies whether the IP address of the network interface is the primary private IP address (available only in Amazon Virtual Private Cloud). Type: Boolean
`network-interface.addresses.association.public-ip` | The ID representing the association of a VPC Elastic IP address with a network interface in a VPC (available only in Amazon Virtual Private Cloud). Type: String
`network-interface.addresses.association.ip-owner-id` | The owner ID of the private IP address associated with the network interface (available only in Amazon Virtual Private Cloud). Type: String
`association.public-ip` | The address of the Elastic IP address bound to the network interface (available only in Amazon Virtual Private Cloud). Type: String
`association.ip-owner-id` | The owner of the Elastic IP address associated with the network interface (available only in Amazon Virtual Private Cloud). Type: String
`association.allocation-id` | The allocation ID that AWS returned when you allocated the Elastic IP address for your network interface (available only in Amazon Virtual Private Cloud). Type: String
`association.association-id` | The association ID returned when the network interface was associated with an IP address (available only in Amazon Virtual Private Cloud). Type: String

**Response Elements**

The elements in the following table are wrapped in a `DescribeInstancesResponse` element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>requestId</code></td>
<td>The ID of the request. Type: <code>xsd:string</code></td>
</tr>
<tr>
<td><code>reservationSet</code></td>
<td>A list of reservations, each one wrapped in an <code>item</code> element. Type: <code>ReservationInfoType (p. 509)</code></td>
</tr>
</tbody>
</table>
Examples

Example Request

This example describes the current state of the instances owned by your AWS account.

https://ec2.amazonaws.com/?Action=DescribeInstances &AUTHPARAMS

DescribeInstanceStatus

Description

Describes the status of one or more Amazon EC2 instances, including any scheduled events. Instance status has two main components:

- **System Status** reports impaired functionality that stems from issues related to the systems that support an instance, such as hardware failures and network connectivity problems. The DescribeInstanceStatus response elements report such problems as impaired reachability.
- **Instance Status** reports impaired functionality that arises from problems internal to the instance. The DescribeInstanceStatus response elements report such problems as impaired reachability.

Instance status provides information about three types of scheduled events for an instance that may require your attention:

- **Scheduled Reboot:** When Amazon EC2 determines that an instance must be rebooted, the instance's status will return one of two event codes: `system-reboot` or `instance-reboot`. System reboot commonly occurs if certain maintenance or upgrade operations require a reboot of the underlying host that supports an instance. Instance reboot commonly occurs if the instance must be rebooted, rather than the underlying host. Rebooting events include a scheduled start and end time.

- **System Maintenance:** When Amazon EC2 determines that an instance requires maintenance that requires power or network impact, the instance's status will return an event code called `system-maintenance`. System maintenance is either power maintenance or network maintenance. For power maintenance, your instance will be unavailable for a brief period of time and then rebooted. For network maintenance, your instance will experience a brief loss of network connectivity. System maintenance events include a scheduled start and end time. You will also be notified by email if one of your instances is set for system maintenance. The email message indicates when your instance is scheduled for maintenance.

- **Scheduled Retirement:** When Amazon EC2 determines that an instance must be shut down, the instance's status returns an event code called `instance-retirement`. Retirement commonly occurs when the underlying host is degraded and must be replaced. Retirement events include a scheduled start and end time. You will also be notified by email if one of your instances is set to retiring. The email message indicates when your instance will be permanently retired.

When your instance is retired, it will either be terminated (if its root device type is the instance-store) or stopped (if its root device type is an EBS volume). Instances stopped due to retirement will not be restarted, but you can do so manually. You can also avoid retirement of EBS-backed instances by manually restarting your instance when its event code is `instance-retirement`. This ensures that your instance is started on a different underlying host.

**Request Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>InstanceId</td>
<td>The list of instance IDs. If not specified, all instances are described.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Constraints: Maximum 100 explicitly specified instance IDs.</td>
<td></td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Required</td>
</tr>
<tr>
<td>-------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>----------</td>
</tr>
<tr>
<td><code>IncludeAllInstances</code></td>
<td>When <code>true</code>, returns the health status for all instances (for example, running, stopped, pending, shutting down). When <code>false</code>, returns only the health status for running instances. Type: Boolean Default: false</td>
<td>No</td>
</tr>
<tr>
<td><code>MaxResults</code></td>
<td>The maximum number of paginated instance items per response. Type: Integer Default: 1000</td>
<td>No</td>
</tr>
<tr>
<td><code>NextToken</code></td>
<td>The next paginated set of results to return. Type: String Default: None</td>
<td>No</td>
</tr>
</tbody>
</table>

**Supported Filters**

You can specify filters so that the response includes information for only certain instances. For example, you can use a filter to specify that you're interested in instances in a specific Availability Zone. You can specify multiple values for a filter. The response includes information for an instance only if it matches at least one of the filter values that you specified.

You can specify multiple filters; for example, specify instances that are in a specific Availability Zone and have a status of retiring. The response includes information for an instance only if it matches all the filters that you specified. If there's no match, no special message is returned, the response is simply empty.

You can use wildcards in a filter value. An asterisk (*) matches zero or more characters, and a question mark (?) matches exactly one character. You can escape special characters using a backslash (\) before the character. For example, a value of `*amazon\\` searches for the literal string `*amazon\\`.

The following table lists the available filters.

<table>
<thead>
<tr>
<th>Filter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>availability-zone</code></td>
<td>The Availability Zone of the instance. Type: String</td>
</tr>
<tr>
<td><code>event.code</code></td>
<td>The code identifying the type of event. Type: String</td>
</tr>
<tr>
<td></td>
<td>Valid values: <code>instance-reboot</code></td>
</tr>
<tr>
<td><code>event.description</code></td>
<td>A description of the event. Type: String</td>
</tr>
<tr>
<td><code>event.not-after</code></td>
<td>The latest end time for the scheduled event. Type: DateTime</td>
</tr>
<tr>
<td><code>event.not-before</code></td>
<td>The earliest start time for the scheduled event. Type: DateTime</td>
</tr>
</tbody>
</table>
**Filter Name** | **Description**
---|---
instance-state-name | The state of the instance. Type: String
| Valid values: pending | running | shutting-down | terminated | stopping | stopped
instance-state-code | A code representing the state of the instance. The high byte is an opaque internal value and should be ignored. The low byte is set based on the state represented. Type: Integer (16-bit unsigned integer)
| Valid values: 0 (pending) | 16 (running) | 32 (shutting-down) | 48 (terminated) | 64 (stopping) | 80 (stopped)

**system-status.status** | The system status of the instance. Type: String
| Valid values: ok | impaired | initializing | insufficient-data | not-applicable

**system-status.reachability** | Filters on system status where the name is reachability. Type: String
| Valid values: passed | failed | initializing | insufficient-data

**instance-status.status** | The status of the instance. Type: String
| Valid values: ok | impaired | initializing | insufficient-data | not-applicable

**instance-status.reachability** | Filters on instance status where the name is reachability. Type: String
| Valid values: passed | failed | initializing | insufficient-data

**Response Elements**

The elements in the following table are wrapped in a DescribeInstanceStatusResponse element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request. Type: xsd:string</td>
</tr>
<tr>
<td>instanceStatusSet</td>
<td>A set of InstanceStatusItemType (p. 485) elements that describe the status of each instance.</td>
</tr>
</tbody>
</table>
### Examples

#### Example Request

This example returns instance status descriptions for all instances.

```
https://ec2.amazonaws.com/?
Action=DescribeInstanceStatus
&Version=2011-10-01
&AuthParams
```

#### Example Request

This example returns instance status descriptions for the specified instances.

```
https://ec2.amazonaws.com/?
Action=DescribeInstanceStatus
&InstanceId.0=i-0cf27c63
&InstanceId.1=i-283f9f47
&Version=2011-10-01
&AuthParams
```

#### Example Request

This example returns instance status descriptions for all instances specified by supported DescribeInstanceStatus filters.

```
https://ec2.amazonaws.com/?
Action=DescribeInstanceStatus
&Filter.0.Name=system-status.reachability
&Filter.0.Value.failed
&Version=2011-10-01
&AuthParams
```

#### Example Response

```
<DescribeInstanceStatusResponse xmlns='http://ec2.amazonaws.com/doc/2012-04-01'/>
  <requestId>3be1508e-c44-4fef-89cc-0b12234f02f</requestId>
  <instanceStatusSet>
    <item>
      <instanceId>i-283f9f47</instanceId>
      <availabilityZone>us-east-1d</availabilityZone>
      <instanceState>
```

DescribeInternetGateways

Description

Describes one or more of your Internet gateways.

For more information about Amazon Virtual Private Cloud and Internet gateways, see the Amazon Virtual Private Cloud User Guide.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>InternetGatewayId.n</td>
<td>One or more Internet gateway IDs.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td>Filter.n.Name</td>
<td>The name of a filter. See the table in the Supported Filters section for a list of supported filter names.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td>Filter.n.Value.m</td>
<td>A value for the filter. See the table in the Supported Filters section for a list of supported values for each filter.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
</tbody>
</table>

Supported Filters

You can specify filters so that the response includes information for only certain Internet gateways. For example, you can use a filter to specify that you're interested in the Internet gateways with particular tags. You can specify multiple values for a filter. The response includes information for an Internet gateway only if it matches at least one of the filter values that you specified.

You can specify multiple filters; for example, specify Internet gateways that are attached to a specific VPC and have a specific tag. The response includes information for an Internet gateway only if it matches all the filters that you specified. If there's no match, no special message is returned, the response is simply empty.

You can use wildcards in a filter value. An asterisk (*) matches zero or more characters, and a question mark (?) matches exactly one character. You can escape special characters using a backslash (\) before the character. For example, a value of \*amazon\?\ searches for the literal string *amazon?\.

The following table lists the available filters.
### Filter Name

<table>
<thead>
<tr>
<th>Filter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>attachment.state</td>
<td>The current state of the attachment between the gateway and the VPC. Returned only if a VPC is attached. Type: String Valid value: available</td>
</tr>
<tr>
<td>attachment.vpc-id</td>
<td>The ID of an attached VPC. Type: String</td>
</tr>
<tr>
<td>internet-gateway-id</td>
<td>The ID of the Internet gateway. Type: String</td>
</tr>
<tr>
<td>tag-key</td>
<td>The key of a tag assigned to the resource. This filter is independent of the tag-value filter. For example, if you use both the filter &quot;tag-key=Purpose&quot; and the filter &quot;tag-value=X&quot;, you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the tag: key filter later in this table. For more information about tags, see Tagging Your Resources in the Amazon Elastic Compute Cloud User Guide. Type: String</td>
</tr>
<tr>
<td>tag-value</td>
<td>The value of a tag assigned to the resource. This filter is independent of the tag-key filter. Type: String</td>
</tr>
<tr>
<td>tag: key</td>
<td>Filters the response based on a specific tag/value combination. Example: To list just the resources that have been assigned tag Purpose=X, specify: Filter.1.Name=tag:Purpose Filter.1.Value.1=X Example: To list just resources that have been assigned tag Purpose=X OR Purpose=Y, specify: Filter.1.Name=tag:Purpose Filter.1.Value.1=X Filter.1.Value.2=Y</td>
</tr>
</tbody>
</table>

### Response Elements

The elements in the following table are wrapped in a DescribeInternetGatewaysResponse element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request. Type: xsd:string</td>
</tr>
<tr>
<td>internetGatewaysSet</td>
<td>A list of Internet gateways, each one wrapped in an item element. Type: InternetGatewayType (p. 488)</td>
</tr>
</tbody>
</table>
Examples

Example Request
This example describes your Internet gateways.

https://ec2.amazonaws.com/?Action=DescribeInternetGateways

Example Response

<DescribeInternetGatewaysResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <internetGatewaySet>
    <item>
      <internetGatewayId>igw-eaad4883EXAMPLE</internetGatewayId>
      <attachmentSet>
        <item>
          <vpcId>vpc-11ad4878</vpcId>
          <state>available</state>
        </item>
      </attachmentSet>
      <tagSet/>
    </item>
  </internetGatewaySet>
</DescribeInternetGatewaysResponse>

DescribeKeyPairs

Description

Describes one or more of your key pairs.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>KeyName.n</td>
<td>One or more key pair names. Type: String&lt;br&gt;Default: Describes all key pairs you own, or only those otherwise specified.</td>
<td>No</td>
</tr>
<tr>
<td>Filter.n.Name</td>
<td>The name of a filter. See the table in the Supported Filters section for a list of supported filter names.&lt;br&gt;Type: String&lt;br&gt;Default: None</td>
<td>No</td>
</tr>
<tr>
<td>Filter.n.Value.m</td>
<td>A value for the filter. See the table in the Supported Filters section for a list of supported values for each filter.&lt;br&gt;Type: String&lt;br&gt;Default: None</td>
<td>No</td>
</tr>
</tbody>
</table>

Supported Filters

You can specify filters so that the response includes information for only certain key pairs. For example, you can use a filter to specify that you’re interested in key pairs whose names include the string Dave. You can specify multiple values for a filter. The response includes information for a key pair only if it matches at least one of the filter values that you specified.

You can specify multiple filters; for example, specify key pairs whose names include the string Dave and whose fingerprint is a specific value. The response includes information for a key pair only if it matches all the filters that you specified. If there’s no match, no special message is returned, the response is simply empty.

You can use wildcards in a filter value. An asterisk (*) matches zero or more characters, and a question mark (?) matches exactly one character. You can escape special characters using a backslash (\) before the character. For example, a value of /*amazon\\?\" searches for the literal string *amazon?\.

The following table lists the available filters.

<table>
<thead>
<tr>
<th>Filter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fingerprint</td>
<td>The fingerprint of the key pair. Type: String</td>
</tr>
<tr>
<td>key-name</td>
<td>The name of the key pair. Type: String</td>
</tr>
</tbody>
</table>
Response Elements

The elements in the following table are wrapped in a `DescribeKeyPairsResponse` element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request. Type: xsd:string</td>
</tr>
<tr>
<td>keySet</td>
<td>A list of key pairs, each one wrapped in an <code>item</code> element. Type: <code>DescribeKeyPairsResponseItemType</code> (p. 453)</td>
</tr>
</tbody>
</table>

Examples

Example Request

This example describes the keypair with name gsg-keypair.

https://ec2.amazonaws.com/?Action=DescribeKeyPairs
&KeyName.1=gsg-keypair
&AUTHPARAMS

Example Response

```xml
<DescribeKeyPairsResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <keySet>
    <item>
      <keyName>gsg-keypair</keyName>
      <keyFingerprint>
        00:00:00:00:00:00:00:00:00:00:00:00:00:00:00:00:00:00:00:00
      </keyFingerprint>
    </item>
  </keySet>
</DescribeKeyPairsResponse>
```

Example Request

This example filters the response to include only key pairs whose names include the string Dave.

https://ec2.amazonaws.com/?Action=DescribeKeyPairs
&Filter.1.Name=key-name
&Filter.1.Value.1=*Dave*
&AUTHPARAMS

DescribeNetworkAcls

Description

Describes the network ACLs in your VPC.

For more information about Amazon Virtual Private Cloud and network ACLs, see Network ACLs in the Amazon Virtual Private Cloud User Guide.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>NetworkAclId.n</td>
<td>One or more network ACL IDs. Type: String</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td>Filter.n.Name</td>
<td>The name of a filter. See the table in the Supported Filters section for a list of supported filter names. Type: String Default: None</td>
<td>No</td>
</tr>
<tr>
<td>Filter.n.Value.m</td>
<td>A value for the filter. See the table in the Supported Filters section for a list of supported values for each filter. Type: String Default: None</td>
<td>No</td>
</tr>
</tbody>
</table>

Supported Filters

You can specify filters so that the response includes information for only certain ACLs. For example, you can use a filter to specify that you're interested in the ACLs associated with a particular subnet. You can specify multiple values for a filter. The response includes information for an ACL only if it matches at least one of the filter values that you specified.

You can specify multiple filters; for example, specify ACLs that are associated with a specific subnet and have an egress entry that denies traffic to a specific port. The response includes information for an ACL only if it matches all the filters that you specified. If there's no match, no special message is returned, the response is simply empty.

You can use wildcards in a filter value. An asterisk (*) matches zero or more characters, and a question mark (?) matches exactly one character. You can escape special characters using a backslash (\) before the character. For example, a value of `*amazon\?\` searches for the literal string `*amazon?\`.

The following table lists the available filters.

<table>
<thead>
<tr>
<th>Filter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>association.association-id</td>
<td>The ID of an association ID for the ACL. Type: String</td>
</tr>
<tr>
<td>Filter Name</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>association.network-acl-id</td>
<td>The ID of the network ACL involved in the association. Type: String</td>
</tr>
<tr>
<td>association.subnet-id</td>
<td>The ID of the subnet involved in the association. Type: String</td>
</tr>
<tr>
<td>default</td>
<td>Indicates whether the ACL is the default network ACL in the VPC. Type: Boolean</td>
</tr>
<tr>
<td>entry.cidr</td>
<td>The CIDR range specified in the entry. Type: String</td>
</tr>
<tr>
<td>entry.egress</td>
<td>Indicates whether the entry applies to egress traffic. Type: Boolean</td>
</tr>
<tr>
<td>entry.icmp.code</td>
<td>The ICMP code specified in the entry, if any. Type: Integer</td>
</tr>
<tr>
<td>entry.icmp.type</td>
<td>The ICMP type specified in the entry, if any. Type: Integer</td>
</tr>
<tr>
<td>entry.port-range.from</td>
<td>The start of the port range specified in the entry. Type: Integer</td>
</tr>
<tr>
<td>entry.port-range.to</td>
<td>The end of the port range specified in the entry. Type: Integer</td>
</tr>
<tr>
<td>entry.protocol</td>
<td>The protocol specified in the entry. Type: String</td>
</tr>
<tr>
<td></td>
<td>Valid values: tcp</td>
</tr>
<tr>
<td>entry.rule-action</td>
<td>Indicates whether the entry allows or denies the matching traffic. Type: String</td>
</tr>
<tr>
<td></td>
<td>Valid values: allow</td>
</tr>
<tr>
<td>entry.rule-number</td>
<td>The number of an entry (i.e., rule) in the ACL’s set of entries. Type: Integer</td>
</tr>
<tr>
<td>network-acl-id</td>
<td>The ID of the network ACL. Type: String</td>
</tr>
</tbody>
</table>
Filter Name | Description
---|---
tag-key | The key of a tag assigned to the resource. This filter is independent of the tag-value filter. For example, if you use both the filter "tag-key=Purpose" and the filter "tag-value=X", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the tag: key filter later in this table.
For more information about tags, see Tagging Your Resources in the Amazon Elastic Compute Cloud User Guide.
Type: String

tag-value | The value of a tag assigned to the resource. This filter is independent of the tag-key filter.
Type: String

tag: key | Filters the response based on a specific tag/value combination.
Example: To list just the resources that have been assigned tag Purpose=X, specify: Filter.1.Name=tag:Purpose Filter.1.Value.1=X
Example: To list just resources that have been assigned tag Purpose=X OR Purpose=Y, specify: Filter.1.Name=tag:Purpose Filter.1.Value.1=X Filter.1.Value.2=Y

vpc-id | The ID of the VPC the network ACL is in.
Type: String

Response Elements

The elements in the following table are wrapped in a DescribeNetworkAclsResponse element.

| Name         | Description
|--------------|-------------
| requestId    | The ID of the request.
Type: xsd:string

| NetworkAclSet | A list of network ACLs, each one wrapped in an item element.
Type: NetworkAclType (p. 496)
Examples

Example Request

This example describes all the network ACLs in your VPC.

https://ec2.amazonaws.com/?Action=DescribeNetworkAcls

Example Response

The first ACL in the returned list is the VPC's default ACL.

```xml
<DescribeNetworkAclsResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">

DescribeNetworkInterfaceAttribute

Description

Describes a network interface attribute. You can specify only one attribute at a time.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>NetworkInterfaceId</td>
<td>The ID of the network interface. Type: String</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td>Attribute</td>
<td>The attribute of the network interface. Type: String</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Valid values: description</td>
<td>groupSet</td>
</tr>
</tbody>
</table>

Response Elements

The elements in the following table are wrapped in a `DescribeNetworkInterfaceAttributeResponse` element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request. Type: xsd:string</td>
</tr>
<tr>
<td>networkInterfaceId</td>
<td>The ID of the network interface. Type: xsd:string</td>
</tr>
</tbody>
</table>

Examples

Example Request

This example describes the attributes of a network interface.

http://ec2.us-east-1.amazonaws.com/?Action=DescribeNetworkInterfaceAttribute&NetworkInterfaceId=eni-686ea200&Attribute=sourceDestCheck&AUTH_PARAMS

Example Response

```xml
<DescribeNetworkInterfaceAttributeResponse
  <requestId>7a20c6b2-d71c-45fb-bba7-37306850544b</requestId>
</DescribeNetworkInterfaceAttributeResponse>
```
<networkInterfaceId>eni-686ea200</networkInterfaceId>
<sourceDestCheck>
  <value>true</value>
</sourceDestCheck>
</DescribeNetworkInterfaceAttributeResponse>

DescribeNetworkInterfaces

Description

Describes one or more of your network interfaces.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>NetworkInterfaceId.n</td>
<td>One or more network interface IDs.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td>Filter.n.Name</td>
<td>The name of a filter. See the table in the Supported Filters section for a list of supported filter names.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td>Filter.n.Value.m</td>
<td>A value for the filter. See the table in the Supported Filters section for a list of supported values for each filter.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
</tbody>
</table>

Supported Filters

You can specify filters so that the response includes information for only certain network interfaces. For example, you can use a filter to specify that you're interested in network interfaces launched in a specific Availability Zone. You can specify multiple values for a filter. The response includes information for a network interface only if it matches at least one of the filter values that you specified.

You can specify multiple filters; for example, specify network interfaces in a specific Availability Zone, and that have a specific owner ID. The response includes information for a network interface only if it matches all the filters that you specified. If there's no match, no special message is returned, the response is simply empty.

You can use wildcards in a filter value. An asterisk (*) matches zero or more characters, and a question mark (?) matches exactly one character. You can escape special characters using a backslash (\) before the character. For example, a value of \*amazon\?\ searches for the literal string *amazon?\.

The following table lists the available filters.

<table>
<thead>
<tr>
<th>Filter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>addresses.private-ip-address</td>
<td>The private IP addresses associated with the network interface. Type: String</td>
</tr>
<tr>
<td>addresses.primary</td>

DescribePlacementGroups

Description

Describes one or more of your placement groups. For more information about placement groups and cluster instances, see Using Cluster Instances in the Amazon Elastic Compute Cloud User Guide.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>GroupName.n</td>
<td>One or more placement group names.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: Describes all your placement groups, or only those otherwise specified.</td>
<td></td>
</tr>
<tr>
<td>Filter.n.Name</td>
<td>The name of a filter. See the table in the Supported Filters section for a list of supported filter names.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td>Filter.n.Value.m</td>
<td>A value for the filter. See the table in the Supported Filters section for a list of supported values for each filter.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
</tbody>
</table>

Supported Filters

You can specify filter so that the response includes information for only certain placement groups. For example, you can use a filter to specify that you're interested in groups in the deleted state. You can specify multiple values for a filter. The response includes information for a placement group only if it matches at least one of the filter values that you specified.

You can specify multiple filters; for example, specify group's that are in the deleted state and have a name that includes the string Project. The response includes information for a group only if it matches all your filters. If there's no match, no special message is returned, the response is simply empty.

You can use wildcards in a filter value. An asterisk (*) matches zero or more characters, and a question mark (?) matches exactly one character. You can escape special characters using a backslash (\) before the character. For example, a value of `*amazon?\` searches for the literal string `*amazon?\`.

The following table lists the available filters.

<table>
<thead>
<tr>
<th>Filter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>group-name</td>
<td>The name of the placement group.</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
</tr>
<tr>
<td>state</td>
<td>The state of the placement group.</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
</tr>
<tr>
<td></td>
<td>Valid values: pending</td>
</tr>
</tbody>
</table>
### Filter Name | Description
--- | ---
strategy | The strategy of the placement group. Type: String
| Valid value: cluster

### Response Elements
The elements in the following table are wrapped in a `DescribePlacementGroupsResponse` element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request. Type: xsd:string</td>
</tr>
<tr>
<td>placementGroupSet</td>
<td>A list of placement groups, each one wrapped in an item element. Type: PlacementGroupInfoType (p. 500)</td>
</tr>
</tbody>
</table>

### Examples

#### Example Request
This example describes the placement group named XYZ-cluster.

```text
curl https://ec2.amazonaws.com/?Action=DescribePlacementGroups &GroupName.1=XYZ-cluster &AUTHPARAMS
```

#### Example Response

```xml
<DescribePlacementGroupsResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
  <requestID>d4904fd9-82c2-4ea5-adfe-a9cc3EXAMPLE</requestID>
  <placementGroupSet>
    <item>
      <groupName>XYZ-cluster</groupName>
      <strategy>cluster</strategy>
      <state>available</state>
    </item>
  </placementGroupSet>
</DescribePlacementGroupsResponse>
```

#### Example Request
This example filters the response to include only placement groups that include the string Project in the name.

```text
curl https://ec2.amazonaws.com/?Action=DescribePlacementGroups &Filter.1.Name=group-name
```

DescribeRegions

Description

Describes one or more regions that are currently available to you.

For a list of the regions supported by Amazon EC2, see Regions and Endpoints.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>RegionName.n</td>
<td>One or more region names. Type: String</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Default: Describes all regions available to the account.</td>
<td></td>
</tr>
<tr>
<td>Filter.n.Name</td>
<td>The name of a filter. See the table in the Supported Filters section for a list of supported filter names. Type: String Default: None</td>
<td>No</td>
</tr>
<tr>
<td>Filter.n.Value.m</td>
<td>A value for the filter. See the table in the Supported Filters section for a list of supported values for each filter. Type: String Default: None</td>
<td>No</td>
</tr>
</tbody>
</table>

Supported Filters

You can specify filters so that the response includes information for only certain regions.

You can use wildcards in a filter value. An asterisk (*) matches zero or more characters, and a question mark (?) matches exactly one character. You can escape special characters using a backslash (\) before the character. For example, a value of "*amazon\?\" searches for the literal string *amazon?\.

The following table lists the available filters.

<table>
<thead>
<tr>
<th>Filter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>endpoint</td>
<td>The endpoint of the region (for example, ec2.us-east-1.amazonaws.com). Type: String</td>
</tr>
<tr>
<td>region-name</td>
<td>The name of the region. Type: String</td>
</tr>
</tbody>
</table>

Response Elements

The elements in the following table are wrapped in a DescribeRegionsResponse element.
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request.</td>
</tr>
<tr>
<td></td>
<td>Type: xsd:string</td>
</tr>
<tr>
<td>regionInfo</td>
<td>A list of regions, each one wrapped in an item element.</td>
</tr>
<tr>
<td></td>
<td>Type: RegionItemType (p. 509)</td>
</tr>
</tbody>
</table>

### Examples

#### Example Request

This example displays information about all regions.

https://ec2.amazonaws.com/?Action=DescribeRegions &AUTHPARAMS

#### Example Request

This example displays information about just the specified regions.

https://ec2.amazonaws.com/?Action=DescribeRegions &RegionName.1=us-east-1 &RegionName.2=eu-west-1 &AUTHPARAMS

#### Example Response

```xml
<DescribeRegionsResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <regionInfo>
    <item>
      <regionName>us-east-1</regionName>
      <regionEndpoint>ec2.us-east-1.amazonaws.com</regionEndpoint>
    </item>
    <item>
      <regionName>eu-west-1</regionName>
      <regionEndpoint>ec2.eu-west-1.amazonaws.com</regionEndpoint>
    </item>
  </regionInfo>
</DescribeRegionsResponse>
```

#### Example Request

This example displays information about all regions that have the string `ap` in the endpoint.

Example Response

```
<DescribeRegionsResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <regionInfo>
    <item>
      <regionName>ap-southeast-1</regionName>
      <regionEndpoint>ec2.ap-southeast-1.amazonaws.com</regionEndpoint>
    </item>
  </regionInfo>
</DescribeRegionsResponse>
```

Related Operations

- RunInstances (p. 417)
DescribeReservedInstances

Description

Describes one or more of the Reserved Instances that you purchased.

Starting with the 2011-11-01 API version, AWS expanded its offering of Amazon EC2 Reserved Instances to address a range of projected instance use. There are three types of Reserved Instances based on customer utilization levels: Heavy Utilization, Medium Utilization, and Light Utilization. You determine the type of the Reserved Instances offerings by including the optional offeringType parameter. The Medium Utilization offering type is equivalent to the Reserved Instance offering available before API version 2011-11-01. If you are using tools that predate the 2011-11-01 API version, you only have access to the Medium Utilization Reserved Instance offering type.

For more information about Reserved Instances, see Reserved Instances in the Amazon Elastic Compute Cloud User Guide.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>$ReservedInstancesId.$n</td>
<td>One or more Reserved Instance IDs. Type: String Default: Describes all your Reserved Instances, or only those otherwise specified.</td>
<td>No</td>
</tr>
<tr>
<td>$Filter.$n.$Name</td>
<td>The name of a filter. See the table in the Supported Filters section for a list of supported filter names. Type: String Default: None</td>
<td>No</td>
</tr>
<tr>
<td>$Filter.$n.$Value.$m</td>
<td>A value for the filter. See the table in the Supported Filters section for a list of supported values for each filter. Type: String Default: None</td>
<td>No</td>
</tr>
<tr>
<td>offeringType</td>
<td>The Reserved Instance offering type. Type: String Valid values: Heavy Utilization</td>
<td>Medium Utilization</td>
</tr>
</tbody>
</table>

Supported Filters

You can specify filter so that the response includes information for only certain Reserved Instances. For example, you can use a filter to specify that you’re interested in Reserved Instances in a specific Availability Zone. You can specify multiple values for a filter. The response includes information for a Reserved Instance only if it matches at least one of the filter values that you specified.

You can specify multiple filters; for example, specify Reserved Instances that are in a specific Availability Zone and have a specific tag. The response includes information for a Reserved Instance only if it matches all of the filters that you specified. If there’s no match, no special message is returned, the response is simply empty.
You can use wildcards in a filter value. An asterisk (*) matches zero or more characters, and a question mark (?) matches exactly one character. You can escape special characters using a backslash (\) before the character. For example, a value of \*amazon\?\ searches for the literal string *amazon?\.

The following table lists the available filters.

<table>
<thead>
<tr>
<th>Filter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>availability-zone</td>
<td>The Availability Zone where the Reserved Instance can be used. Type: String</td>
</tr>
<tr>
<td>duration</td>
<td>The duration of the Reserved Instance (one year or three years), in seconds. Type: Long Valid values: 31536000</td>
</tr>
<tr>
<td>fixed-price</td>
<td>The purchase price of the Reserved Instance (for example, 9800.0) Type: Double</td>
</tr>
<tr>
<td>instance-type</td>
<td>The instance type on which the Reserved Instance can be used. Type: String</td>
</tr>
<tr>
<td>product-description</td>
<td>The product description of the Reserved Instance. Type: String Valid values: Linux/UNIX</td>
</tr>
<tr>
<td>reserved-instances-id</td>
<td>The ID of the Reserved Instance. Type: String</td>
</tr>
<tr>
<td>start</td>
<td>The time at which the Reserved Instance purchase request was placed (for example, 2010-08-07T11:54:42.000Z). Type: DateTime</td>
</tr>
<tr>
<td>state</td>
<td>The state of the Reserved Instance. Type: String Valid values: pending-payment</td>
</tr>
<tr>
<td>tag-key</td>
<td>The key of a tag assigned to the resource. This filter is independent of the tag-value filter. For example, if you use both the filter &quot;tag-key=</td>
</tr>
<tr>
<td>tag-value</td>
<td>The value of a tag assigned to the resource. This filter is independent of the tag-key filter. Type: String</td>
</tr>
</tbody>
</table>

API Version 2012-10-01

249
Filter Name | Description
--- | ---
tag: key | Filters the response based on a specific tag/value combination. Example: To list just the resources that have been assigned tag Purpose=X, specify:  
Filter.1.Name=tag:Purpose  
Filter.1.Value.1=X  
Example: To list just resources that have been assigned tag Purpose=X OR Purpose=Y, specify:  
Filter.1.Name=tag:Purpose  
Filter.1.Value.1=X  
Filter.1.Value.2=Y

usage-price | The usage price of the Reserved Instance, per hour (for example, 0.84)  
Type: Double

**Response Elements**

The elements in the following table are wrapped in a `DescribeReservedInstancesResponse` element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| requestId | The ID of the request.  
Type: xsd:string |
| reservedInstancesSet | A list of Reserved Instances, each one wrapped in an `item` element.  
Type: `DescribeReservedInstancesResponseSetItemType` (p. 458) |

**Examples**

**Example Request**

This example describes Reserved Instances owned by your account.

https://ec2.amazonaws.com/?Action=DescribeReservedInstances &AUTHPARAMS

**Example Response**

```xml
<DescribeReservedInstancesResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <reservedInstancesSet>
    <item>
      <reservedInstancesId>4b2293b4-5813-4cc8-9ce3-1957fc1dcfc8EXAMPLE</reservedInstancesId>
      <instanceType>m1.xlarge</instanceType>
      <availabilityZone>us-east-1a</availabilityZone>
    </item>
  </reservedInstancesSet>
</DescribeReservedInstancesResponse>
```
Example Request

This example filters the response to include only one-year, m1.small Linux/UNIX Reserved Instances. If you want Linux/UNIX Reserved Instances specifically for use with Amazon VPC, set the product description to Linux/UNIX (Amazon VPC).

https://ec2.amazonaws.com/?Action=DescribeReservedInstances
&Filter.1.Name=duration
&Filter.1.Value.1=31536000
&Filter.2.Name=instance-type
&Filter.2.Value.1=m1.small
&Filter.3.Name=product-description
&Filter.3.Value.1=Linux/UNIX
&AUTHPARAMS

- DescribeReservedInstancesOfferings (p. 256)
# DescribeReservedInstancesListings

## Description

Describes your account's Reserved Instance listings in the Reserved Instance Marketplace. This call returns information, such as the ID of the Reserved Instance to which a listing is associated.

The Reserved Instance Marketplace matches sellers who want to resell Reserved Instance capacity that they no longer need with buyers who want to purchase additional capacity. Reserved Instances bought and sold through the Reserved Instance Marketplace work like any other Reserved Instances.

As a seller, you choose to list some or all of your Reserved Instances, and you specify the upfront price you want to receive for them. Your Reserved Instances are then listed in the Reserved Instance Marketplace and are available for purchase.

As a buyer, you specify the configuration of the Reserved Instance you want to purchase, and the Marketplace will match what you’re searching for with what’s available. The Marketplace will first sell the lowest priced Reserved Instances to you, and continue to sell available Reserved Instance listings to you until your demand is met. You will be charged based on the total price of all of the listings that you purchase.

## Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ReservedInstancesListingId.n</code></td>
<td>The information about the Reserved Instance listing wrapped in an <code>item</code> element. Type: DescribeReservedInstancesListingSetItemType (p.455) Default: None</td>
<td>No</td>
</tr>
<tr>
<td><code>ReservedInstancesId.n</code></td>
<td>The set of Reserved Instances IDs which are used to see associated listings. Type: DescribeReservedInstancesSetItemType (p.459) Default: None</td>
<td>No</td>
</tr>
<tr>
<td><code>Filter.n.Name</code></td>
<td>The name of a filter. See the table in the Supported Filters section for a list of supported filter names. Type: String Default: None</td>
<td>No</td>
</tr>
<tr>
<td><code>Filter.n.Value.m</code></td>
<td>A value for the filter. See the table in the Supported Filters section for a list of supported values for each filter. Type: String Default: None</td>
<td>No</td>
</tr>
</tbody>
</table>
Supported Filters

Our policy is to provide filters for all `ec2-describe` calls so that you can limit the response to your specified criteria. Therefore, you can use filters to limit the response when describing Reserved Instances listings, even though you can use other options instead.

For example, you can use a filter or an option to get the listing of Reserved Instances that are in an active state. You can also specify multiple options or filters (for example, to limit the response to the Reserved Instances listings that are in the closed state with a specific status message). The response includes information for a listing only if it matches all options or filters. If there's no match, no special message is returned, the response is simply empty.

You can use wildcards in a filter value. An asterisk (*) matches zero or more characters, and a question mark (?) matches exactly one character. You can escape special characters using a backslash (\) before the character. For example, a value of `\*amazon\?\` searches for the literal string `*amazon?\`.

The following table lists the available filters.

<table>
<thead>
<tr>
<th>Filter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>status</td>
<td>Status of the Reserved Instance listing. Valid values: pending</td>
</tr>
<tr>
<td>status-message</td>
<td>Reason for the status. Type: String</td>
</tr>
<tr>

DescribeReservedInstancesOfferings

Description

Describes Reserved Instance offerings that are available for purchase. With Amazon EC2 Reserved
Instances, you purchase the right to launch Amazon EC2 instances for a period of time. During that time
period you will not receive insufficient capacity errors, and you will pay a lower usage rate than the rate
charged for On-Demand instances for the actual time used.

Starting with the 2011-11-01 API version, AWS expanded its offering of Amazon EC2 Reserved
Instances to address a range of projected instance usage. There are three types of Reserved Instances based on
customer utilization levels: Heavy Utilization, Medium Utilization, and Light Utilization. You determine the
type of the Reserved Instances offerings by including the optional offeringType parameter when calling
DescribeReservedInstancesOfferings. The Medium Utilization offering type is equivalent to the
Reserved Instance offering available before API version 2011-11-01. If you are using tools that predate
the 2011-11-01 API version, DescribeReservedInstancesOfferings will only list information about
the Medium Utilization Reserved Instance offering type.

For information about Reserved Instances pricing, go to Understanding Reserved Instance Pricing Tiers
in the Amazon Elastic Compute Cloud User Guide. For more information about Reserved Instances, go
to Reserved Instances also in the Amazon Elastic Compute Cloud User Guide.

Starting with the 2012-08-15 API version, AWS offers the Reserved Instance Marketplace, where you
can buy and sell Reserved Instances. The Reserved Instance Marketplace matches sellers who want to
resell Reserved Instance capacity that they no longer need with buyers who want to purchase additional
capacity. Reserved Instances bought and sold through the Reserved Instance Marketplace work like any
other Reserved Instances.

By default, with the 2012-08-15 API version, DescribeReservedInstancesOfferings returns
information about AWS and Reserved Instance Marketplace offerings. If you are using tools that predate
the 2012-08-15 API version, DescribeReservedInstancesOfferings will only list information about
the Amazon EC2 Reserved Instance offerings.

For more information about the Reserved Instance Marketplace, go to Reserved Instance Marketplace
in the Amazon Elastic Compute Cloud User Guide.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
</table>
| ReservedInstancesOfferingId.n             | One or more Reserved Instances offering IDs.  
Type: String  
Default: None | No                   |
| InstanceType                              | The Amazon EC2 instance type on which the Reserved Instance can be used.  
Type: String  
Default: None | No                   |
| AvailabilityZone                         | The Availability Zone in which the Reserved Instance can be used.  
Type: String  
Default: None | No                   |
<table>
<thead>
<tr>
<th>Name</th>

</tr>
</tbody>
</table>
**NextToken**

Token to use when requesting the next paginated set of offerings.
Type: String
Default: First page of results if the string is empty.

**MaxResults**

Maximum number of offerings to return.
Type: Integer
Default: 1000
Maximum: 1000

---

**Supported Filters**

Our policy is to provide filters for all `ec2-describe` calls so that you can limit the response to your specified criteria. Therefore, you can use filters to limit the response when describing Reserved Instances offerings, even though you can use other options instead.

For example, you could use an option or a filter to get the offerings for a specific instance type. You can specify multiple options or filters (for example, limit the response to the m2.xlarge instance type, and only for Windows instances). The response includes information for an offering only if it matches all options or filters. If there's no match, no special message is returned, the response is simply empty.

You can use wildcards in a filter value. An asterisk (*) matches zero or more characters, and a question mark (?) matches exactly one character. You can escape special characters using a backslash (\) before the character. For example, a value of `\*amazon\?\` searches for the literal string `*amazon?\`.

The following table lists the available filters.

<table>
<thead>
<tr>
<th>Filter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>availability-zone</td>
<td>The Availability Zone where the Reserved Instance can be used. Type: String</td>
</tr>
<tr>
<td>duration</td>
<td>The duration of the Reserved Instance (for example, one year or three years), in seconds. Type: Long Valid values: 31536000</td>
</tr>
<tr>
<td>fixed-price</td>
<td>The purchase price of the Reserved Instance (for example, 9800.0) Type: Double</td>
</tr>
<tr>
<td>instance-type</td>
<td>The Amazon EC2 instance type on which the Reserved Instance can be used. Type: String</td>
</tr>
<tr>
<td>marketplace</td>
<td>Set to true to show only Reserved Instance Marketplace offerings. When this filter is not used, which is the default behavior, all offerings from AWS and Reserved Instance Marketplace are listed. Type: Boolean</td>
</tr>
<tr>
<td>Filter Name</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>

<td>The description of the Reserved Instance. Type: String</td>
</tr>
<tr>
<td></td>
<td>Valid values: Linux/UNIX</td>
</tr>
<tr>
<td>reserved-instances-offering-id</td>
<td>The Reserved Instances offering ID. Type: String</td>
</tr>
<tr>
<td>usage-price</td>
<td>The usage price of the Reserved Instance, per hour (for example, 0.84) Type: Double</td>
</tr>
</tbody>
</table>

### Response Elements

The elements in the following table are wrapped in a `DescribeReservedInstancesOfferingsResponse` element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request. Type: String</td>
</tr>
<tr>
<td>reservedInstancesOfferingsSet</td>
<td>A list of Reserved Instances offerings. Each offering's information is wrapped in an item element. Type: DescribeReservedInstancesOfferingsResponseSetItemType (p. 456)</td>
</tr>
<tr>
<td>nextToken</td>
<td>Specifies the next paginated set of results to return. Type: String</td>
</tr>
</tbody>
</table>

### Examples

#### Example Describing Reserved Instance Marketplace Offerings Only

This example requests a list of Linux/UNIX, Light Utilization Reserved Instances that are available through the Reserved Instance Marketplace only.

```plaintext
http://ec2.amazonaws.com/?Action=DescribeReservedInstancesOfferings
&Filter.0.Name=marketplace
&Filter.0.Value.1=true
&IncludeMarketplace=true
&OfferingType=Light+Utilization
&ProductDescription=Linux%2FUNIX
&Version=2012-08-15
&AUTHPARAMS
```
Note

When using the Query API the "/" is denoted as "%2F".

This is the response listing Reserved Instance Marketplace offerings only.

```xml
<DescribeReservedInstancesOfferingsResponse xmlns='http://ec2.amazonaws.com/doc/2012-08-15/'>
  <requestId>2bc7dafa-dafd-4257-bdf9-c0814EXAMPLE</requestId>
  <reservedInstancesOfferingsSet>
    <item>
      <reservedInstancesOfferingId>a6ce8269-7b8c-42cd-a7f5-0841c726be4c</reservedInstancesOfferingId>
      <instanceType>m1.large</instanceType>
      <availabilityZone>us-east-1a</availabilityZone>
      <duration>90720000</duration>
      <fixedPrice>4083.333333</fixedPrice>
      <usagePrice>0.124</usagePrice>
      <productDescription>Linux/UNIX</productDescription>
      <instanceTenancy>default</instanceTenancy>
      <currencyCode>USD</currencyCode>
      <offeringType>Light Utilization</offeringType>
      <recurringCharges/>
      <marketplace>true</marketplace>
      <pricingDetailsSet>
        <item>
          <price>4083.333333</price>
          <count>1</count>
        </item>
      </pricingDetailsSet>
    </item>
    <item>
      <reservedInstancesOfferingId>9948307c-4e03-4ffb-8bd3-8dea689513cb</reservedInstancesOfferingId>
      <instanceType>m1.xlarge</instanceType>
      <availabilityZone>us-east-1b</availabilityZone>
      <duration>28512000</duration>
      <fixedPrice>430.0</fixedPrice>
      <usagePrice>0.312</usagePrice>
      <productDescription>Linux/UNIX</productDescription>
      <instanceTenancy>default</instanceTenancy>
      <currencyCode>USD</currencyCode>
      <offeringType>Light Utilization</offeringType>
      <recurringCharges/>
      <marketplace>true</marketplace>
      <pricingDetailsSet>
        <item>
          <price>430.0</price>
          <count>2</count>
        </item>
      </pricingDetailsSet>
    </item>
  </reservedInstancesOfferingsSet>
</DescribeReservedInstancesOfferingsResponse>
```
Example Describing AWS Offerings Only

By default, with the 2012-08-15 API version, DescribeReservedInstancesOfferings returns information about AWS Reserved Instances and Reserved Instance Marketplace offerings. If you want a list of AWS offerings only, set IncludeMarketplace to false.

http://ec2.amazonaws.com/?Action=DescribeReservedInstancesOfferings
&IncludeMarketplace=false
&Version=2012-08-15
&AUTHPARAMS

Example Using MaxResults and nextToken to Manage Results

API version 2012-08-15 provides pagination support, which means that you can query the results sequentially and in parts. Use MaxResults to specify the maximum number of results that will be returned in the response. Then each paginated response will contain a nextToken, which can be provided as input to a subsequent DescribeReservedInstancesOfferings call to fetch the next page.

http://ec2.amazonaws.com/?Action=DescribeReservedInstancesOfferings
&MaxResults=5
&Version=2012-08-15
&AUTHPARAMS

The response should look similar to the following example.

<DescribeReservedInstancesOfferingsResponse>
  <requestId>d072f652-cc57-458c-89e0-e6c02EXAMPLE</requestId>
  <reservedInstancesOfferingsSet>
    <item>
      <reservedInstancesOfferingId>649fd0c8-7846-46b8-8f84-a6400ea2a8f4</reservedInstancesOfferingId>
      <instanceType>m1.large</instanceType>
      <availabilityZone>us-east-1a</availabilityZone>
      <duration>94608000</duration>
      <fixedPrice>1200.0</fixedPrice>
      <usagePrice>0.0</usagePrice>
      <productDescription>Linux/UNIX (Amazon VPC)</productDescription>
      <instanceTenancy>default</instanceTenancy>
      <currencyCode>USD</currencyCode>
      <offeringType>Heavy Utilization</offeringType>
      <recurringCharges>
        <item>
          <frequency>Hourly</frequency>
          <amount>0.052</amount>
        </item>
      </recurringCharges>
      <marketplace>false</marketplace>
      <pricingDetailsSet/>
    </item>
    <item>
      <reservedInstancesOfferingId>e5a2ff3b-a4f3-477c-8928-dbd0016caddb</reservedInstancesOfferingId>
      <instanceType>m1.large</instanceType>
    </item>
  </reservedInstancesOfferingsSet>
</DescribeReservedInstancesOfferingsResponse>
Then, you can use the nextToken to fetch the next page. The request should look like the following example.

```
http://ec2.amazonaws.com/?Action=DescribeReservedInstancesOfferings&MaxResults=5&NextToken=h/C8YKPQBHEjW8xKz1827/Zzyb0VqsqkJRo3TqhFYeE=&Version=2012-08-15
&AUTHPARAMS
```

The response should be similar to the following example.

```
<DescribeReservedInstancesOfferingsResponse>
  <requestId>652900ca-902c-42fa-b8ae-da67bEXAMPLE</requestId>
  <reservedInstancesOfferingsSet>
    <item>
      <reservedInstancesOfferingId>438012d3-496e-4ab3-b1f6-38ffe8469244</reservedInstancesOfferingId>
      <instanceType>m1.large</instanceType>
      <availabilityZone>us-east-1a</availabilityZone>
      <duration>94608000</duration>
      <fixedPrice>425.2</fixedPrice>
      <usagePrice>0.124</usagePrice>
      <productDescription>Linux/UNIX</productDescription>
      <instanceTenancy>default</instanceTenancy>
      <currencyCode>USD</currencyCode>
      <offeringType>Light Utilization</offeringType>
      <recurringCharges/>
      <marketplace>false</marketplace>
      <pricingDetailsSet/>
    </item>
    <item>
      <reservedInstancesOfferingId>248e7b75-579e-4599-a34d-cb6aa9ba2ac8</reservedInstancesOfferingId>
      <instanceType>m1.large</instanceType>
      <availabilityZone>us-east-1a</availabilityZone>
      <duration>31536000</duration>
      <fixedPrice>780.0</fixedPrice>
      <usagePrice>0.0</usagePrice>
      <productDescription>Linux/UNIX</productDescription>
    </item>
  </reservedInstancesOfferingsSet>
</DescribeReservedInstancesOfferingsResponse>
```
Example Request

This example describes available Reserved Instance offerings.

https://ec2.amazonaws.com/?Action=DescribeReservedInstancesOfferings

Example Response

Example Request

This example filters the response to include only one-year, m1.small or m1.large Linux/UNIX Reserved Instances. If you want Linux/UNIX Reserved Instances specifically for use with Amazon VPC, set the product description to Linux/UNIX (Amazon VPC).
Related Operations

- PurchaseReservedInstancesOffering (p. 371)
- DescribeReservedInstances (p. 248)
DescribeRouteTables

Description

Describes one or more of your route tables.

For more information about Amazon Virtual Private Cloud and route tables, see Route Tables in the Amazon Virtual Private Cloud User Guide.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>RouteTableId.n</td>
<td>One or more route table IDs. Type: String Default: Returns all route tables, or only those otherwise specified.</td>
<td>No</td>
</tr>
<tr>
<td>Filter.n.Name</td>
<td>The name of a filter. See the table in the Supported Filters section for a list of supported filter names. Type: String Default: None</td>
<td>No</td>
</tr>
<tr>
<td>Filter.n.Value.m</td>
<td>A value for the filter. See the table in the Supported Filters section for a list of supported values for each filter. Type: String Default: None</td>
<td>No</td>
</tr>
</tbody>
</table>

Supported Filters

You can specify filters so that the response includes information for only certain tables. For example, you can use a filter to specify that you're interested in the tables associated with a particular subnet. You can specify multiple values for a filter. The response includes information for a table only if it matches at least one of the filter values that you specified.

You can specify multiple filters; for example, specify tables that have a specific route and are associated with a specific subnet. The response includes information for a table only if it matches all the filters that you specified. If there's no match, no special message is returned, the response is simply empty.

You can use wildcards in a filter value. An asterisk (*) matches zero or more characters, and a question mark (?) matches exactly one character. You can escape special characters using a backslash (\) before the character. For example, a value of \\*amazon\?\ searches for the literal string *amazon?\.

The following table lists the available filters.

<table>
<thead>
<tr>
<th>Filter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>association.route-table-association-id</td>
<td>The ID of an association ID for the route table. Type: String</td>
</tr>
<tr>
<td>Filter Name</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>association.route-table-id</td>
<td>The ID of the route table involved in the association. Type: String</td>
</tr>
<tr>
<td>association.subnet-id</td>
<td>The ID of the subnet involved in the association. Type: String</td>
</tr>
<tr>
<td>association.main</td>
<td>Indicates whether the route table is the main route table in the VPC. Type: Boolean</td>
</tr>
<tr>
<td>route-table-id</td>
<td>The ID of the route table. Type: String</td>
</tr>
<tr>
<td>route.destination-cidr-block</td>
<td>The CIDR range specified in a route in the table. Type: String</td>
</tr>
<tr>
<td>route.gateway-id</td>
<td>The ID of a gateway specified in a route in the table. Type: String</td>
</tr>
<tr>
<td>route.instance-id</td>
<td>The ID of an instance specified in a route in the table. Type: String</td>
</tr>
<tr>
<td>route.origin</td>
<td>Describes how the route was created. Type: String</td>
</tr>
<tr>
<td></td>
<td>Valid values: CreateRouteTable</td>
</tr>
<tr>
<td></td>
<td>CreateRouteTable indicates that route was automatically created when the route table was created.</td>
</tr>
<tr>
<td></td>
<td>CreateRoute indicates that the route was manually added to the route table.</td>
</tr>
<tr>
<td></td>
<td>EnableVgwRoutePropogation indicates that the route was propagated by route propagation.</td>
</tr>
<tr>
<td>route.state</td>
<td>The state of a route in the route table. The blackhole state indicates that the route's target isn't available (for example, the specified gateway isn't attached to the VPC, the specified NAT instance has been terminated, and so on). Type: String</td>
</tr>
<tr>
<td></td>
<td>Valid values: active</td>
</tr>
<tr>
<td>Filter Name</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>-------------</td>
</tr>
<tr>
<td>tag-key</td>
<td>The key of a tag assigned to the resource. This filter is independent of the tag-value filter. For example, if you use both the filter &quot;tag-key=Purpose&quot; and the filter &quot;tag-value=X&quot;, you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the tag: key filter later in this table. For more information about tags, see Tagging Your Resources in the Amazon Elastic Compute Cloud User Guide. Type: String</td>
</tr>
<tr>
<td>tag-value</td>
<td>The value of a tag assigned to the resource. This filter is independent of the tag-key filter. Type: String</td>
</tr>
<tr>
<td>tag: key</td>
<td>Filters the response based on a specific tag/value combination. Example: To list just the resources that have been assigned tag Purpose=X, specify: Filter.1.Name=tag:Purpose Filter.1.Value.1=X Example: To list just resources that have been assigned tag Purpose=X OR Purpose=Y, specify: Filter.1.Name=tag:Purpose Filter.1.Value.1=X Filter.1.Value.2=Y</td>
</tr>
<tr>
<td>vpc-id</td>
<td>The ID of the VPC the route table is in. Type: String</td>
</tr>
</tbody>
</table>

**Response Elements**

The elements in the following table are wrapped in a `DescribeRouteTablesResponse` element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>

DescribeSecurityGroups

Description

Describes one or more of your security groups. This includes both EC2 security groups and VPC security groups. For information about how the two types of groups differ, see Security Groups in the Amazon Virtual Private Cloud User Guide.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>GroupName.n</td>
<td>One or more security group names.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: Describes all groups you own, or only those otherwise specified.</td>
<td></td>
</tr>
<tr>
<td>GroupId.n</td>
<td>One or more security group IDs.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: Describes all groups you own, or only those otherwise specified.</td>
<td></td>
</tr>
<tr>
<td>Filter.n.Name</td>
<td>The name of a filter. See the table in the Supported Filters section for a list of supported filter names.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td>Filter.n.Value.m</td>
<td>A value for the filter. See the table in the Supported Filters section for a list of supported values for each filter.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
</tbody>
</table>

Supported Filters

You can specify filters so that the response includes information for only certain security groups. For example, you can use a filter to specify that you're interested in groups whose name contains a specific string. You can specify multiple values for a filter. The response includes information for a security group only if it matches at least one of the filter values that you specified.

You can specify multiple filters; for example, specify group's whose name contains a specific string, and that give permission to another security group with a different string in its name. The response includes information for a group only if it matches all the filters that you specified. If there's no match, no special message is returned, the response is simply empty.

Important

Filters are based on literal strings only. This is important to remember when you want to use filters to return only security groups with access allowed on a specific port number or numbers. For example, suppose that you want to get all groups that have access on port 22, and that GroupA gives access on a range of ports using fromPort=20 and toPort=30. If you filter with ip-permission.from-port=22 or ip-permission.to-port=22 (or both), the response does not contain information for GroupA. You get information for GroupA only if you specify ip-permission.from-port=20 or ip-permission.to-port=30 (or both).
You can use wildcards in a filter value. An asterisk (*) matches zero or more characters, and a question mark (?) matches exactly one character. You can escape special characters using a backslash (\) before the character. For example, a value of "amazon\?$\" searches for the literal string "amazon?\.".

The following table lists the available filters.

<table>
<thead>
<tr>
<th>Filter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>description</td>
<td>The description of the security group. Type: String</td>
</tr>
<tr>
<td>group-id</td>
<td>The ID of the security group. Type: String</td>
</tr>
<tr>
<td>group-name</td>
<td>The name of the security group. Type: String</td>
</tr>
<tr>
<td>ip-permission.cidr</td>
<td>The CIDR range that has been granted the permission. Type: String</td>
</tr>
<tr>
<td>ip-permission.from-port</td>
<td>The start of port range for the TCP and UDP protocols, or an ICMP type number. Type: String</td>
</tr>
<tr>
<td>ip-permission.group-name</td>
<td>The name of security group that has been granted the permission. Type: String</td>
</tr>
<tr>
<td>ip-permission.protocol</td>
<td>The IP protocol for the permission. Type: String Valid values: tcp</td>
</tr>
<tr>
<td>ip-permission.to-port</td>
<td>The end of port range for the TCP and UDP protocols, or an ICMP code. Type: String</td>
</tr>
<tr>
<td>ip-permission.user-id</td>
<td>The ID of an AWS account that has been granted the permission. Type: String</td>
</tr>
<tr>
<td>owner-id</td>
<td>The AWS account ID of the owner of the security group. Type: String</td>
</tr>
<tr>
<td>tag-key</td>
<td>The key of a tag assigned to the security group. Type: String</td>
</tr>
<tr>
<td>tag-value</td>
<td>The value of a tag assigned to the security group. Type: String</td>
</tr>
</tbody>
</table>
Response Elements

The elements in the following table are wrapped in a `DescribeSecurityGroupsResponse` element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| requestId          | The ID of the request.  
Type: `xsd:string`                                                             |
| securityGroupInfo  | A list of security groups, each one wrapped in an `item` element.  
Type: `SecurityGroupItemType` (p. 518)                                   |

Examples

Example Request

This example returns information about two security groups that are configured for the account.

&GroupName.1=WebServers  
&GroupName.2=RangedPortsBySource  
&amp;AUTHPARAMS

Example Response

```xml
<DescribeSecurityGroupsResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">  
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>  
  <securityGroupInfo>  
    <item>  
      <ownerId>111122223333</ownerId>  
      <groupId>sg-443d0a12</groupId>  
      <groupName>WebServers</groupName>  
      <groupDescription>Web Servers</groupDescription>  
      <vpcId/>  
      <ipPermissions>  
        <item>  
          <ipProtocol>tcp</ipProtocol>  
          <fromPort>80</fromPort>  
          <toPort>80</toPort>  
          <groups/>  
          <ipRanges>  
            <item>  
              <cidrIp>0.0.0.0/0</cidrIp>  
            </item>  
          </ipRanges>  
        </item>  
        <item>  
          <ipPermissionsEgress/>  
          <tagSet/>  
        </item>  
      </ipPermissions>  
    </item>  
  </securityGroupInfo>  
</DescribeSecurityGroupsResponse>`
Example Request

This example returns information about all security groups that grant access over TCP specifically on port 22 from instances in either the app_server_group or database_group.

&Filter.1.Name=ip-permission.protocol
&Filter.1.Value.1=tcp
&Filter.2.Name=ip-permission.from-port
&Filter.2.Value.1=22
&Filter.3.Name=ip-permission.to-port
&Filter.3.Value.1=22
&Filter.4.Name=ip-permission.group-name
&Filter.4.Value.1=app_server_group
&Filter.4.Value.2=database_group
&AUTHPARAMS

DescribeSnapshotAttribute

Description

Describes an attribute of the specified snapshot. You can specify only one attribute at a time.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>SnapshotId</td>
<td>The ID of the Amazon EBS snapshot.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td>Attribute</td>
<td>The snapshot attribute.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Valid values: createVolumePermission</td>
<td>productCodes</td>
</tr>
</tbody>
</table>

Response Elements

The elements in the following table are wrapped in a DescribeSnapshotAttributeResponse element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request.</td>
</tr>
<tr>
<td></td>
<td>Type: xsd:string</td>
</tr>
<tr>
<td>snapshotId</td>
<td>The ID of the Amazon EBS snapshot.</td>
</tr>
<tr>
<td></td>
<td>Type: xsd:string</td>
</tr>
<tr>
<td>createVolumePermission</td>
<td>A list of permissions for creating volumes from the snapshot. Each permission is wrapped in an item element. Type: CreateVolumePermissionItemType (p. 449)</td>
</tr>
<tr>
<td>productCodes</td>
<td>A list of product codes. Each product code is wrapped in an item element that contains a product code and a type. Type: ProductCodesSetItemType (p. 507)</td>
</tr>
</tbody>
</table>

Examples

Example Request

This example describes permissions for the snap-78a54011 snapshot.

https://ec2.amazonaws.com/?Action=DescribeSnapshotAttribute
&SnapshotId=snap-78a54011
Example Response

```xml
<DescribeSnapshotAttributeResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <snapshotId>snap-78a54011</snapshotId>
  <createVolumePermission>
    <item>
      <group>all</group>
    </item>
  </createVolumePermission>
</DescribeSnapshotAttributeResponse>
```

Example Request

This example describes product codes associated with the snap-78a12345 snapshot.

```url
https://ec2.amazonaws.com/?Action=DescribeSnapshotAttribute
&SnapshotId=snap-78a12345
&Attribute=productCodes
&AUTHPARAMS
```

Example Response

```xml
<DescribeSnapshotAttributeResponse xmlns="http://ec2.amazonaws.com/doc/2012-04-01/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <snapshotId>snap-78a12345</snapshotId>
  <productCodes>
    <item>
      <productCode>a1b2c3d4e5f6g7h8i9j10k11</productCode>
      <type>marketplace</type>
    </item>
  </productCodes>
</DescribeSnapshotAttributeResponse>
```

DescribeSnapshots

Description

Describes one or more of the Amazon EBS snapshots available to you. Snapshots available to you include public snapshots available for any AWS account to launch, private snapshots you own, and private snapshots owned by another AWS account but for which you've been given explicit create volume permissions.

The create volume permissions fall into 3 categories:

<table>
<thead>
<tr>
<th>Permission</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>public</td>
<td>The owner of the snapshot granted create volume permissions for the snapshot to the <em>all</em> group. All AWS accounts have create volume permissions for these snapshots.</td>
</tr>
<tr>
<td>explicit</td>
<td>The owner of the snapshot granted create volume permissions to a specific AWS account.</td>
</tr>
<tr>
<td>implicit</td>
<td>An AWS account has implicit create volume permissions for all snapshots it owns.</td>
</tr>
</tbody>
</table>

The list of snapshots returned can be modified by specifying snapshot IDs, snapshot owners, or AWS accounts with create volume permissions. If no options are specified, Amazon EC2 returns all snapshots for which you have create volume permissions.

If you specify one or more snapshot IDs, only snapshots that have the specified IDs are returned. If you specify an invalid snapshot ID, an error is returned. If you specify a snapshot ID for which you do not have access, it will not be included in the returned results.

If you specify one or more snapshot owners, only snapshots from the specified owners and for which you have access are returned. The results can include the AWS account IDs of the specified owners, *amazon* for snapshots owned by Amazon, or *self* for snapshots that you own.

If you specify a list of restorable users, only snapshots with create snapshot permissions for those users are returned. You can specify AWS account IDs (if you own the snapshot(s)), *self* for snapshots for which you own or have explicit permissions, or *all* for public snapshots.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>SnapshotId.n</td>
<td>One or more snapshot IDs. Type: String Default: Describes snapshots for which you have launch permissions.</td>
<td>No</td>
</tr>
<tr>
<td>Owner.n</td>
<td>Returns the snapshots owned by the specified owner. Multiple owners can be specified. Type: String Valid values: <em>self</em></td>
<td>No</td>
</tr>
<tr>
<td></td>
<td><em>amazon</em></td>
<td>AWS Account ID Default: None</td>
</tr>
</tbody>
</table>
Name | Description | Required
--- | --- | ---
RestorableBy.n | One or more AWS accounts IDs that can create volumes from the snapshot. Type: String Default: None | No
Filter.n.Name | The name of a filter. See the table in the Supported Filters section for a list of supported filter names. Type: String Default: None | No
Filter.n.Value.m | A value for the filter. See the table in the Supported Filters section for a list of supported values for each filter. Type: String Default: None | No

**Supported Filters**

You can specify filters so that the response includes information for only certain snapshots. For example, you can use a filter to specify that you’re interested in snapshots whose status is `pending`. You can specify multiple values for a filter. The response includes information for a snapshot only if it matches at least one of the filter values that you specified.

You can specify multiple filters; for example, specify snapshot's that have a `pending` status, and have a specific tag. The response includes information for a snapshot only if it matches all the filters that you specified. If there’s no match, no special message is returned, the response is simply empty.

You can use wildcards in a filter value. An asterisk (*) matches zero or more characters, and a question mark (?) matches exactly one character. You can escape special characters using a backslash (\) before the character. For example, a value of `\*amazon\?\` searches for the literal string `*amazon?\`.

The following table lists the available filters.

<table>
<thead>
<tr>
<th>Filter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>description</td>
<td>A description of the snapshot. Type: String</td>
</tr>
<tr>
<td>owner-alias</td>
<td>The AWS account alias (for example, amazon) that owns the snapshot. Type: String</td>
</tr>
<tr>
<td>owner-id</td>
<td>The ID of the AWS account that owns the snapshot. Type: String</td>
</tr>
<tr>
<td>progress</td>
<td>The progress of the snapshot, as a percentage (for example, 80%). Type: String</td>
</tr>
<tr>
<td>snapshot-id</td>
<td>The snapshot ID. Type: String</td>
</tr>
<tr>
<td>start-time</td>
<td>The time stamp when the snapshot was initiated. Type: DateTime</td>
</tr>
<tr>
<td>Filter Name</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>-------------</td>
</tr>
<tr>
<td>status</td>
<td>The status of the snapshot. Type: String Valid values: pending</td>
</tr>
<tr>
<td>tag-key</td>
<td>The key of a tag assigned to the resource. This filter is independent of the tag-value filter. For example, if you use both the filter &quot;tag-key=Purpose&quot; and the filter &quot;tag-value=X&quot;, you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the tag: key filter later in this table. For more information about tags, see Tagging Your Resources in the Amazon Elastic Compute Cloud User Guide. Type: String</td>
</tr>
<tr>
<td>tag-value</td>
<td>The value of a tag assigned to the resource. This filter is independent of the tag-key filter. Type: String</td>
</tr>
<tr>
<td>tag: key</td>
<td>Filters the response based on a specific tag/value combination. Example: To list just the resources that have been assigned tag Purpose=X, specify: Filter.1.Name=tag:Purpose Filter.1.Value.1=X Example: To list just resources that have been assigned tag Purpose=X OR Purpose=Y, specify: Filter.1.Name=tag:Purpose Filter.1.Value.1=X Filter.1.Value.2=Y</td>
</tr>
<tr>
<td>volume-id</td>
<td>The ID of the volume the snapshot is for. Type: String</td>
</tr>
<tr>
<td>volume-size</td>
<td>The size of the volume, in GiB (for example, 20). Type: String</td>
</tr>
</tbody>
</table>

**Response Elements**

The elements in the following table are wrapped in a `DescribeSnapshotsResponse` element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request. Type: xsd:string</td>
</tr>
<tr>
<td>snapshotSet</td>
<td>A list of snapshots. Each snapshot is wrapped in an <code>item</code> element. Type: <code>DescribeSnapshotsSetItemResponseType</code> (p. 460)</td>
</tr>
</tbody>
</table>

DescribeSpotDatafeedSubscription

Description

Describes the datafeed for Spot Instances. For more information about Spot Instances, see Spot Instances in the Amazon Elastic Compute Cloud User Guide.

Request Parameters

The DescribeSpotDatafeedSubscription operation does not have any request parameters.

Response Elements

The elements in the following table are wrapped in a DescribeSpotDatafeedSubscriptionResponse element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| requestId                | The ID of the request.  
  Type: xsd:string                                                         |
| spotDatafeedSubscription | The Spot Instance datafeed subscription.  
  Type: SpotDatafeedSubscriptionType (p. 519)                                |

Examples

Example Request

This example describes the datafeed for the account.

https://ec2.amazonaws.com/?Action=DescribeSpotDatafeedSubscription &AUTHPARAMS

Example Response

<DescribeSpotDatafeedSubscriptionResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <spotDatafeedSubscription>
    <ownerId>111122223333</ownerId>
    <bucket>myawsbucket</bucket>
    <prefix>spotdata</prefix>
    <state>Active</state>
  </spotDatafeedSubscription>
</DescribeSpotDatafeedSubscriptionResponse>

Related Operations

- CreateSpotDatafeedSubscription (p. 97)
- DeleteSpotDatafeedSubscription (p. 143)
DescribeSpotInstanceRequests

Description

Describes the Spot Instance requests that belong to your account. Spot Instances are instances that Amazon EC2 starts on your behalf when the maximum price that you specify exceeds the current Spot Price. Amazon EC2 periodically sets the Spot Price based on available Spot Instance capacity and current Spot Instance requests. For more information about Spot Instances, see Spot Instances in the Amazon Elastic Compute Cloud User Guide.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>SpotInstanceRequestId.n</td>
<td>One or more Spot Instance request IDs. Type: String</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td>Filter.n.Name</td>
<td>The name of a filter. See the table in the Supported Filters section for a list of supported filter names. Type: String</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td>Filter.n.Value.m</td>
<td>A value for the filter. See the table in the Supported Filters section for a list of supported values for each filter. Type: String</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
</tbody>
</table>

Supported Filters

You can specify filters so that the response includes information for only certain Spot Instance requests. For example, you can use a filter to specify that you're interested in requests where the Spot Price is a specific value. (You can't use a greater than or less than comparison, however you can use * and ? wildcards.) You can specify multiple values for a filter. The response includes information for a Spot Instance request only if it matches at least one of the filter values that you specified.

You can specify multiple filters; for example, specify that the Spot Price is a specific value, and that the instance type is m1.small. The response includes information for a request only if it matches all the filters that you specified. If there's no match, no special message is returned, the response is simply empty.

You can use wildcards in a filter value. An asterisk (*) matches zero or more characters, and a question mark (?) matches exactly one character. You can escape special characters using a backslash (\) before the character. For example, a value of \*amazon\?\ searches for the literal string *amazon?\.

The following table lists the available filters.
<table>
<thead>
<tr>
<th>Filter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>availability-zone-group</td>
<td>The Availability Zone group. If you specify the same Availability Zone group for all Spot Instance requests, all Spot Instances are launched in the same Availability Zone. Type: String</td>
</tr>
<tr>
<td>create-time</td>
<td>The time stamp when the Spot Instance request was created. Type: String</td>
</tr>
<tr>
<td>fault-code</td>
<td>The fault code related to the request. Type: String</td>
</tr>
<tr>
<td>fault-message</td>
<td>The fault message related to the request. Type: String</td>
</tr>
<tr>
<td>instance-id</td>
<td>The ID of the instance that fulfilled the request. Type: String</td>
</tr>
<tr>
<td>launch-group</td>
<td>The Spot Instance launch group. Launch groups are Spot Instances that launch together and terminate together. Type: String</td>
</tr>
<tr>
<td>launch.block-device-mapping.delete-on-termination</td>
<td>Whether the Amazon EBS volume is deleted on instance termination. Type: Boolean</td>
</tr>
<tr>
<td>launch.block-device-mapping.device-name</td>
<td>The device name (for example, /dev/sdh) for the Amazon EBS volume. Type: String</td>
</tr>
<tr>
<td>launch.block-device-mapping.snapshot-id</td>
<td>The ID of the snapshot used for the Amazon EBS volume. Type: String</td>
</tr>
<tr>
<td>launch.block-device-mapping.volume-size</td>
<td>The volume size of the Amazon EBS volume, in GiB. Type: String</td>
</tr>
<tr>
<td>launch.block-device-mapping.volume-type</td>
<td>The volume type of the Amazon EBS volume. Valid values: standard</td>
</tr>
<tr>
<td>launch.group-id</td>
<td>The security group the instance is in. Type: String</td>
</tr>
<tr>
<td>launch.image-id</td>
<td>The ID of the AMI. Type: String</td>
</tr>
<tr>
<td>launch.instance-type</td>
<td>The type of instance (for example, m1.small). Type: String</td>
</tr>
<tr>
<td>Filter Name</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>-------------</td>
</tr>
<tr>
<td><code>launch.kernel-id</code></td>
<td>The kernel ID. Type: String</td>
</tr>
<tr>
<td><code>launch.key-name</code></td>
<td>The name of the key pair the instance launched with. Type: String</td>
</tr>
<tr>
<td><code>launch.monitoring-enabled</code></td>
<td>Whether monitoring is enabled for the Spot Instance. Type: Boolean</td>
</tr>
<tr>
<td><code>launch.ramdisk-id</code></td>
<td>The RAM disk ID. Type: String</td>
</tr>
<tr>
<td><code>launch.network-interface.network-interface-id</code></td>
<td>The ID of the network interface (available only in Amazon Virtual Private Cloud). Type: String</td>
</tr>
<tr>
<td><code>launch.network-interface.device-index</code></td>
<td>The index of the device for the network interface attachment on the instance (available only in Amazon Virtual Private Cloud). Type: Integer</td>
</tr>
<tr>
<td><code>launch.network-interface.subnet-id</code></td>
<td>The ID of the subnet that the instance is in (available only in Amazon Virtual Private Cloud). Type: String</td>

</tr>
<tr>
<td></td>
<td>Type: InstanceNetworkInterfaceSetItemType (p. 479)</td>
</tr>
</tbody>
</table>

### Examples

#### Example Request

This example returns information about current Spot Instance requests.
Example Response

Example Request

This example describes all persistent Spot Instance requests that have resulted in the launch of at least one m1.small instance, that has been fulfilled in the us-east-1a Availability Zone, and that also has monitoring enabled.
Related Operations

- RequestSpotInstances (p. 394)

DescribeSpotPriceHistory

Description

Describes the Spot Price history. Spot Instances are instances that Amazon EC2 starts on your behalf when the maximum price that you specify exceeds the current Spot Price. Amazon EC2 periodically sets the Spot Price based on available Spot Instance capacity and current Spot Instance requests. For more information about Spot Instances, see Spot Instances in the Amazon Elastic Compute Cloud User Guide.

When you use the availability-zone option, this command describes the price history for the specified Availability Zone with the most recent set of prices listed first. If you don't specify an Availability Zone, the command returns the prices across all Availability Zones, starting with the most recent set. However, if you use this command with versions of the API earlier than the 2011-05-15 version, this command returns the lowest price across the region for the given time period. The prices returned are listed in chronological order — from the oldest to the most recent.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>StartTime</td>
<td>The start date and time of the Spot Instance price history data. Type: DateTime Default: None</td>
<td>No</td>
</tr>
<tr>
<td>EndTime</td>
<td>The end date and time of the Spot Instance price history data. Type: DateTime Default: None</td>
<td>No</td>
</tr>
<tr>
<td>InstanceType.n</td>
<td>The instance type to return. Type: String Valid values: m1.small</td>
<td>m1.large</td>
</tr>
<tr>
<td>ProductDescription.n</td>
<td>Filters the results by basic product description. Type: String Valid values: Linux/UNIX</td>
<td>SUSE Linux</td>
</tr>
<tr>
<td>Filter.n.Name</td>
<td>The name of a filter. See the table in the Supported Filters section for a list of supported filter names. Type: String Default: None</td>
<td>No</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Required</td>
</tr>
<tr>
<td>------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>----------</td>
</tr>
<tr>
<td>Filter.n.Value.m</td>
<td>A value for the filter. See the table in the Supported Filters section for a list of supported values for each filter. Type: String Default: None</td>
<td>No</td>
</tr>
<tr>
<td>AvailabilityZone</td>
<td>Filters the results by availability zone. Type: String Valid values: us-east-1a, etc. Default: None</td>
<td>No</td>
</tr>
<tr>
<td>MaxResults</td>
<td>Specifies the number of rows to return. Type: Integer Valid values: 0 Default: None</td>
<td>No</td>
</tr>
<tr>
<td>NextToken</td>
<td>Specifies the next set of rows to return. Type: String Valid values: A NextToken value returned by a previous call of the API. Default: None</td>
<td>No</td>
</tr>
</tbody>
</table>

**Supported Filters**

**Note**

Our policy is to provide filters for all ec2-describe calls so you can limit the response to your specified criteria. Therefore, you can use filters to limit the response when describing Spot Price histories, even though you can use the options instead.

For example, you could use an option or a filter to get the history for a particular instance type. You can specify multiple request parameters or filters (for example, limit the response to the m2.xlarge instance type, and only for Windows instances). The response includes information for a price history only if it matches all your options or filters. If there's no match, no special message is returned, the response is simply empty.

You can use wildcards in a filter value. An asterisk (*) matches zero or more characters, and a question mark (?) matches exactly one character. You can escape special characters using a backslash (\) before the character. For example, a value of `\*amazon\?\` searches for the literal string `*amazon?`.

The following table lists the available filters.

<table>
<thead>
<tr>
<th>Filter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>instance-type</td>
<td>The type of instance (for example, m1.small). Type: String</td>
</tr>
<tr>
<td>product-description</td>
<td>The product description for the Spot Price. Type: String Valid values: Linux/UNIX</td>
</tr>
</tbody>
</table>
Response Elements

The elements in the following table are wrapped in a `DescribeSpotPriceHistoryResponse` element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request.</td>
</tr>
<tr>
<td>spotPriceHistorySet</td>
<td>A list of historical Spot Prices. Each price is wrapped in an item element.</td>
</tr>
<tr>
<td>nextToken</td>
<td>The string marking the next set of results returned. Displays empty if there are no more results to be returned.</td>
</tr>
</tbody>
</table>

Examples

Example Request

This example returns Spot Price history for a particular day in December 2009 for Availability Zone us-east-1a.

https://ec2.amazonaws.com/?Action=DescribeSpotPriceHistory
&StartTime=2009-12-04T00:00:00.000Z
&EndTime=2009-12-04T23:59:59.000Z
&AvailabilityZone=us-east-1a
&AUTHPARAMS

This request uses filters instead of regular request parameters to achieve the same results.

https://ec2.amazonaws.com/?Action=DescribeSpotPriceHistory
&Filter.1.Name=timestamp
&Filter.1.Value.1=2009-12-04*
&Filter.2.Name=availability-zone

Filter Name | Description                                                                                                                                 |
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>spot-price</td>
<td>The Spot Price. The value must match exactly (or use wildcards; greater than or less than comparison is not supported). Type: String</td>
</tr>
<tr>
<td>timestamp</td>
<td>The timestamp of the Spot Price history (for example, 2010-08-16T05:06:11.000Z). You can use wildcards (* and ?). Greater than or less than comparison is not supported. Type: DateTime</td>
</tr>
<tr>
<td>availability-zone</td>
<td>The Availability Zone for which prices should be returned. Type: String</td>
</tr>
</tbody>
</table>
Example Response

```xml
<DescribeSpotPriceHistoryResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
    <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
    <spotPriceHistorySet>
        <item>
            <instanceType>m1.small</instanceType>
            <productDescription>Linux/UNIX</productDescription>
            <spotPrice>0.287</spotPrice>
            <timestamp>2009-12-04T20:56:05.000Z</timestamp>
            <availabilityZone>us-east-1a</availabilityZone>
        </item>
        <item>
            <instanceType>m1.small</instanceType>
            <productDescription>Windows</productDescription>
            <spotPrice>0.033</spotPrice>
            <timestamp>2009-12-04T22:33:47.000Z</timestamp>
            <availabilityZone>us-east-1a</availabilityZone>
        </item>
    </spotPriceHistorySet>
    <nextToken/>
</DescribeSpotPriceHistoryResponse>
```

DescribeSubnets

Description

Describes one or more of your subnets.

For more information about Amazon Virtual Private Cloud and subnets, see the Amazon Virtual Private Cloud User Guide.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>SubnetId.n</td>
<td>A subnet ID. You can specify more than one in the request. Type: String</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Default: Describes your subnets</td>
<td></td>
</tr>
<tr>
<td>Filter.n.Name</td>
<td>The name of a filter. See the table in the Supported Filters section for a list of supported filter names. Type: String Default: None</td>
<td>No</td>
</tr>
<tr>
<td>Filter.n.Value.m</td>
<td>A value for the filter. See the table in the Supported Filters section for a list of supported values for each filter. Type: String Default: None</td>
<td>No</td>
</tr>
</tbody>
</table>

Supported Filters

You can specify filters so that the response includes information for only certain subnets. For example, you can use a filter to specify that you’re interested in the subnets in the available state. You can specify multiple values for a filter. The response includes information for a subnet only if it matches at least one of the filter values that you specified.

You can specify multiple filters; for example, specify subnets that are in a specific VPC and are in the available state. The response includes information for a subnet only if it matches all the filters that you specified. If there’s no match, no special message is returned, the response is simply empty.

You can use wildcards in a filter value. An asterisk (*) matches zero or more characters, and a question mark (?) matches exactly one character. You can escape special characters using a backslash (\) before the character. For example, a value of *amazon* searches for the literal string *amazon*.

The following table lists the available filters.

<table>
<thead>
<tr>
<th>Filter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>availability-zone</td>
<td>The Availability Zone the subnet is in. Type: String</td>
</tr>
</tbody>
</table>
### Filter Name | Description
---|---
**available-ip-address-count** | The number of IP addresses in the subnet that are available. Type: String

cidr | The CIDR block of the subnet. The CIDR block you specify must exactly match the subnet's CIDR block for information to be returned for the subnet. Type: String Constraints: Must contain the slash followed by one or two digits (for example, /28)

state | The state of the subnet. Type: String Valid values: pending | available

subnet-id | The ID of the subnet. Type: String

tag-key | The key of a tag assigned to the resource. This filter is independent of the tag-value filter. For example, if you use both the filter "tag-key=Purpose" and the filter "tag-value=tag", you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value tag (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the tag: key filter later in this table. For more information about tags, see Tagging Your Resources in the Amazon Elastic Compute Cloud User Guide. Type: String

tag-value | The value of a tag assigned to the resource. This filter is independent of the tag-key filter. Type: String

tag: key | Filters the response based on a specific tag/value combination. Example: To list just the resources that have been assigned tag Purpose=X, specify:

Filter.1.Name=tag:Purpose
Filter.1.Value.1=X

Example: To list just resources that have been assigned tag Purpose=X OR Purpose=Y, specify:

Filter.1.Name=tag:Purpose
Filter.1.Value.1=X
Filter.1.Value.2=Y

vpc-id | The ID of the VPC the subnet is in. Type: String

### Response Elements

The elements in the following table are wrapped in a DescribeSubnetsResponse element.
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| requestId  | The ID of the request.  
Type: xsd:string                           |
| subnetSet  | A list of subnets. Each subnet is wrapped in an item element.  
Type: SubnetType (p. 524) |

**Examples**

**Example Request**

This example gives a description of two subnets with IDs subnet-9d4a7b6c and subnet-6e7f829e.

https://ec2.amazonaws.com/?Action=DescribeSubnets &SubnetId.1=subnet-9d4a7b6c &SubnetId.2=subnet-6e7f829e &AUTHPARAMS

**Example Response**

```
<DescribeSubnetsResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
    <requestId>7a62c49f-347e-4fc4-9331-6e8eEXAMPLE</requestId>
    <subnetSet>
        <item>
            <subnetId>subnet-9d4a7b6c</subnetId>
            <state>available</state>
            <vpcId>vpc-1a2b3c4d</vpcId>
            <cidrBlock>10.0.1.0/24</cidrBlock>
            <availableIpAddressCount>250</availableIpAddressCount>
            <availabilityZone>us-east-1a</availabilityZone>
            <tagSet/>
        </item>
        <item>
            <subnetId>subnet-6e7f829e</subnetId>
            <state>available</state>
            <vpcId>vpc-1a2b3c4d</vpcId>
            <cidrBlock>10.0.0.0/24</cidrBlock>
            <availableIpAddressCount>250</availableIpAddressCount>
            <availabilityZone>us-east-1a</availabilityZone>
            <tagSet/>
        </item>
    </subnetSet>
</DescribeSubnetsResponse>
```

**Example Request**

This example uses filters to give a description of any subnet you own that is in the VPC with ID vpc-1a2b3c4d or vpc-6e7f8a92, and whose state is available.
https://ec2.amazonaws.com/?Action=DescribeSubnets
&Filter.1.Name=vpc-id
&Filter.1.Value.1=vpc-1a2b3c4d
&Filter.1.Value.2=vpc-6e7f8a92
&Filter.2.Name=state
&Filter.2.Value.1=available
&AUTHPARAMS

DescribeTags

Description

Describes one or more of the tags for your EC2 resources. For more information about tags, see Tagging Your Resources in the Amazon Elastic Compute Cloud User Guide.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Filter.n.Name</td>
<td>The name of a filter. See the table in the Supported Filters section for a list of supported filter names. Type: String Default: None</td>
<td>No</td>
</tr>
<tr>
<td>Filter.n.Value.m</td>
<td>A value for the filter. See the table in the Supported Filters section for a list of supported values for each filter. Type: String Default: None</td>
<td>No</td>
</tr>
</tbody>
</table>

Supported Filters

You can specify filters to limit the response when describing tags. For example, you can use a filter to get only the tags for a specific resource type. You can specify multiple values for a filter. The response includes information for a tag only if it matches at least one of the filter values that you specified.

You can specify multiple filters (for example, specify a specific resource type and tag values that contain the string database). The response includes information for a tag only if it matches all the filters that you specified. If there’s no match, no special message is returned, the response is simply empty.

You can use wildcards in a filter value. An asterisk (*) matches zero or more characters, and a question mark (?) matches exactly one character. You can escape special characters using a backslash (\) before the character. For example, a value of \*amazon\\ searches for the literal string *amazon?\.

The following table lists the available filters.

<table>
<thead>
<tr>
<th>Filter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>key</td>
<td>The tag key. Type: String</td>
</tr>
<tr>
<td>resource-id</td>
<td>The resource ID. Type: String</td>
</tr>
<tr>
<td>resource-type</td>
<td>The resource type. Type: String</td>
</tr>
</tbody>
</table>
Response Elements

The elements in the following table are wrapped in a `DescribeTagsResponse` element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request.</td>
</tr>
<tr>
<td></td>
<td>Type: xsd:string</td>
</tr>
<tr>
<td>tagSet</td>
<td>A list of tags. Each tag is wrapped in an <code>item</code> element.</td>
</tr>
<tr>
<td></td>
<td>Type: <code>TagSetItemType</code> (p. 525)</td>
</tr>
</tbody>
</table>

Examples

Example Request

This example describes all the tags in your account.

https://ec2.amazonaws.com/?Action=DescribeTags
&AUTHPARAMS

Sample response:

```
<DescribeTagsResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
  <requestId>7a62c49f-347e-4fc4-9331-6e8eEXAMPLE</requestId>
  <tagSet>
    <item>
      <resourceId>ami-1a2b3c4d</resourceId>
      <resourceType>image</resourceType>
      <key>webserver</key>
      <value/>
    </item>
    <item>
      <resourceId>ami-1a2b3c4d</resourceId>
      <resourceType>image</resourceType>
      <key>stack</key>
      <value>Production</value>
    </item>
    <item>
      <resourceId>i-5f4e3d2a</resourceId>
      <resourceType>instance</resourceType>
      <key>webserver</key>
      <value/>
    </item>
  </tagSet>
</DescribeTagsResponse>
```
Example Request

This example describes only the tags for the AMI with ID ami-1a2b3c4d.

https://ec2.amazonaws.com/?Action=DescribeTags
&Filter.1.Name=resource-id
&Filter.1.Value.1=ami-1a2b3c4d
&AUTHPARAMS

Sample response:

<DescribeTagsResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
  <requestId>7a62c49f-347e-4fc4-9331-6e8eEXAMPLE</requestId>
  <tagSet>
    <item>
      <resourceId>ami-1a2b3c4d</resourceId>
      <resourceType>image</resourceType>
      <key>webserver</key>
      <value/>
    </item>
    <item>

      <resourceType>image</resourceType>
      <key>stack</key>
      <value>Production</value>
    </item>
    <item>
      <resourceId>ami-1a2b3c4d</resourceId>
      <resourceType>image</resourceType>
      <key>stack</key>
      <value>Test</value>
    </item>
  </tagSet>
</DescribeTagsResponse>

Example Request

This example describes the tags for all your instances.

https://ec2.amazonaws.com/?Action=DescribeTags
&Filter.1.Name=resource-type
Sample response:

```xml
<DescribeTagsResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
   <requestId>7a62c49f-347e-4fc4-9331-6e8eEXAMPLE</requestId>
   <tagSet>
      <item>
         <resourceId>i-5f4e3d2a</resourceId>
         <resourceType>instance</resourceType>
         <key>webserver</key>
         <value/>
      </item>
      <item>
         <resourceId>i-5f4e3d2a</resourceId>
         <resourceType>instance</resourceType>
         <key>stack</key>
         <value>Production</value>
      </item>
      <item>
         <resourceId>i-12345678</resourceId>
         <resourceType>instance</resourceType>
         <key>database_server</key>
         <value/>
      </item>
      <item>
         <resourceId>i-12345678</resourceId>
         <resourceType>instance</resourceType>
         <key>stack</key>
         <value>Test</value>
      </item>
   </tagSet>
</DescribeTagsResponse>
```

**Example Request**

This example describes the tags for all your instances tagged with the key `webserver`. Note that you can use wildcards with filters. So you could specify the value as `?ebserver` to find tags with the key `webserver` or `Webserver`.

Sample response:

```xml
<DescribeTagsResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
   <requestId>7a62c49f-347e-4fc4-9331-6e8eEXAMPLE</requestId>
   <tagSet>
      <item>
         <resourceId>i-5f4e3d2a</resourceId>
         <resourceType>instance</resourceType>
      </item>
   </tagSet>
</DescribeTagsResponse>
```
**Example Request**

This example describes the tags for all your instances tagged with either stack=Test or stack=Production.

```
https://ec2.amazonaws.com/?Action=DescribeTags
&Filter.1.Name=resource-type
&Filter.1.Value.1=instance
&Filter.2.Name=key
&Filter.2.Value.1=stack
&Filter.3.Name=value
&Filter.3.Value.1=Test
&Filter.3.Value.2=Production

**DescribeVolumes**

**Description**

Describes one or more of your Amazon EBS volumes. For more information about Amazon EBS, see Amazon Elastic Block Store in the Amazon Elastic Compute Cloud User Guide.

**Request Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>VolumeId.n</td>
<td>One or more volume IDs. Type: String Default: Describes all volumes that you own, or only those otherwise specified.</td>
<td>No</td>
</tr>
<tr>
<td>Filter.n.Name</td>
<td>The name of a filter. See the table in the Supported Filters section for a list of supported filter names. Type: String Default: None</td>
<td>No</td>
</tr>
<tr>
<td>Filter.n.Value.m</td>
<td>A value for the filter. See the table in the Supported Filters section for a list of supported values for each filter. Type: String Default: None</td>
<td>No</td>
</tr>
</tbody>
</table>

**Supported Filters**

You can specify filters so that the response includes information for only certain volumes. For example, you can use a filter to specify that you're interested in volumes whose status is available. You can specify multiple values for a filter. The response includes information for a volume only if it matches at least one of the filter values that you specified.

You can specify multiple filters (for example, specify that the volume is available, and has a specific tag. The response includes information for a volume only if it matches all the filters that you specified. If there's no match, no special message is returned, the response is simply empty.

You can use wildcards in a filter value. An asterisk (*) matches zero or more characters, and a question mark (?) matches exactly one character. You can escape special characters using a backslash (\) before the character. For example, a value of \\*amazon\?\ checks for the literal string *amazon?\.

The following table lists the available filters.

<table>
<thead>
<tr>
<th>Filter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>attachment.attach-time</td>
<td>The time stamp when the attachment initiated. Type: DateTime</td>
</tr>
<tr>
<td>attachment.delete-on-termination</td>
<td>Whether the volume is deleted on instance termination. Type: Boolean</td>
</tr>
<tr>
<td>Filter Name</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>attachment.device</td>
<td>The device name that is exposed to the instance (for example, /dev/sda1).</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
</tr>
<tr>
<td>attachment.instance-id</td>
<td>The ID of the instance the volume is attached to.</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
</tr>
<tr>
<td>attachment.status</td>
<td>The attachment state.</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
</tr>
<tr>
<td></td>
<td>Valid values: attaching</td>
</tr>
<tr>
<td>availability-zone</td>
<td>The Availability Zone in which the volume was created.</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
</tr>
<tr>
<td>create-time</td>
<td>The time stamp when the volume was created.</td>
</tr>
<tr>
<td></td>
<td>Type: DateTime</td>
</tr>
<tr>
<td>size</td>
<td>The size of the volume, in GiB (for example, 20).</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
</tr>
<tr>
<td>snapshot-id</td>
<td>The snapshot from which the volume was created.</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
</tr>
<tr>
<td>status</td>
<td>The status of the volume.</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
</tr>
<tr>
<td></td>
<td>Valid values: creating</td>
</tr>
<tr>
<td>tag-key</td>
<td>The key of a tag assigned to the resource. This filter is independent of the</td>
</tr>
<tr>
<td></td>
<td>tag-value filter. For example, if you use both the filter</td>
</tr>
<tr>
<td></td>
<td>&quot;tag-key=Purpose&quot; and the filter &quot;tag-value=X&quot;, you get any resources</td>
</tr>
<tr>
<td></td>
<td>assigned both the tag key         Purpose (regardless of what the tag's</td>
</tr>
<tr>
<td></td>
<td>value is), and the tag value x (regardless of what the tag's key is).</td>
</tr>
<tr>
<td></td>
<td>If you want to list only resources where Purpose is X, see the tag: key</td>
</tr>
<tr>
<td></td>
<td>filter later in this table.</td>
</tr>
<tr>
<td></td>
<td>For more information about tags, see Tagging Your Resources in the Amazon</td>
</tr>
<tr>
<td></td>
<td>Elastic Compute Cloud User Guide.</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
</tr>
<tr>
<td>tag-value</td>
<td>The value of a tag assigned to the resource. This filter is independent of</td>
</tr>
<tr>
<td></td>
<td>the tag-key filter.</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
</tr>
</tbody>
</table>
**Filter Name** | **Description**
--- | ---
`tag: key` | Filters the response based on a specific tag/value combination. Example: To list just the resources that have been assigned tag `Purpose=X`, specify: `Filter.1.Name=tag:Purpose Filter.1.Value.1=X` Example: To list just resources that have been assigned tag `Purpose=X OR Purpose=Y`, specify: `Filter.1.Name=tag:Purpose Filter.1.Value.1=X Filter.1.Value.2=Y`
`volume-id` | The volume ID. Type: String
`volume-type` | The Amazon EBS volume type. If the volume is an `io1` volume, the response includes the IOPS as well. Type: String Valid values: `standard | io1`

**Response Elements**

The elements in the following table are wrapped in a `DescribeVolumesResponse` element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request. Type: <code>xsd:string</code></td>

    </item>
  </productCodes>
</DescribeVolumeAttributeResponse>
```

Related Operations

- DescribeVolumeStatus (p. 310)
- ModifyVolumeAttribute (p. 367)
DescribeVolumeStatus

Description

Describes the status of one or more volumes. Volume status provides the result of the checks performed on your volumes to determine events that can impair the performance of your volumes. The performance of a volume can be affected if an issue occurs on the volume's underlying host. If the volume's underlying host experiences a power outage or system issue, once the system is restored there could be data inconsistencies on the volume. Volume events notify you if this occurs. Volume actions notify you if any action needs to be taken in response to the event.

The DescribeVolumeStatus operation provides the following information about the specified volumes:

Status: Reflects the current status of the volume. The possible values are ok, impaired, warning, or insufficient-data. If all checks pass, the overall status of the volume is ok. If the check fails, the overall status is impaired. If the status is insufficient-data, then the checks may still be taking place on your volume at the time. We recommend you retry the request. For more information on volume status, see Monitoring the Status of Your Volumes.

Events: Reflect the cause of a volume status and may require you to take an action. For example, if your volume returns an impaired status, then the volume event might be potential-data-inconsistency. This means that your volume has been affected by an issue with the underlying host, has all I/O operations disabled, and may have inconsistent data.

Actions: Reflect the actions you may have to take in response to an event. For example, if the status of the volume is impaired and the volume event shows potential-data-inconsistency, then the action will show enable-volume-io. This means that you may want to enable the I/O operations for the volume by calling the EnableVolumeIO (p. 342) action and then check the volume for data consistency.

Note

Volume status is based on the volume status checks, and does not reflect the volume state. Therefore, volume status does not indicate volumes in the error state (for example, when a volume is incapable of accepting I/O.)

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>VolumeId.n</td>
<td>One or more volume IDs. Type: String</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Default: Describes all volumes that you own, or only those otherwise specified.</td>
<td></td>
</tr>
<tr>
<td>Filter.n.Name</td>
<td>The name of a filter. See the table in the Supported Filters section for a list of supported filter names.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td>Filter.n.Value.m</td>
<td>A value for the filter. See the table in the Supported Filters section for a list of supported values for each filter.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>

<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
</tbody>
</table>

### Supported Filters

You can specify filters so that the response includes information for only certain volumes. For example, you can use a filter to specify that you’re interested in volumes that have `impaired` status. You can specify multiple values for a filter. The response includes information for a volume only if it matches at least one of the filter values that you specified.

You can specify multiple filters; for example, specify volumes that are in a specific Availability Zone and have the status `impaired`. The response includes information for a volume only if it matches all the filters that you specified. If there’s no match, no special message is returned, the response is simply empty.

You can use wildcards in a filter value. An asterisk (*) matches zero or more characters, and a question mark (?) matches exactly one character. You can escape special characters using a backslash (\) before the character. For example, a value of `*amazon?\` searches for the literal string `*amazon?\`.

The following table lists the available filters.

<table>
<thead>
<tr>
<th>Filter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>availability-zone</td>
<td>The Availability Zone of the instance.</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
</tr>
<tr>
<td>volume-status.status</td>
<td>The status of the volume.</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
</tr>
<tr>
<td></td>
<td>Valid values: ok</td>
</tr>
<tr>
<td>volume-status.details-name</td>
<td>The cause for the volume-status.status.</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>

DescribeVpcs

Description

Describes one or more of your VPCs.

For more information about Amazon Virtual Private Cloud and VPCs, see the Amazon Virtual Private Cloud User Guide.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>VpcId.n</td>
<td>One or more VPC IDs. Type: String Default: Describes your VPCs, or only those otherwise specified</td>
<td>No</td>
</tr>
<tr>
<td>Filter.n.Name</td>
<td>The name of a filter. See the table in the Supported Filters section for a list of supported filter names. Type: String Default: None</td>
<td>No</td>
</tr>
<tr>
<td>Filter.n.Value.m</td>
<td>A value for the filter. See the table in the Supported Filters section for a list of supported values for each filter. Type: String Default: None</td>
<td>No</td>
</tr>
</tbody>
</table>

Supported Filters

You can specify filters so that the response includes information for only certain VPCs. For example, you can use a filter to specify that you're interested in VPCs in the available state. You can specify multiple values for a filter. The response includes information for a VPC only if it matches at least one of the filter values that you specified.

You can specify multiple filters; for example, specify VPCs that use one of several sets of DHCP options and are in the available state. The results include information for a VPC only if it matches all the filters that you specified. If there's no match, no special message is returned, the response is simply empty.

You can use wildcards in a filter value. An asterisk (*) matches zero or more characters, and a question mark (?) matches exactly one character. You can escape special characters using a backslash (\) before the character. For example, a value of \*amazon\?\\ searches for the literal string *amazon?\.

The following table lists the available filters.
### Filter Name

<table>
<thead>
<tr>
<th>Filter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cidr</td>
<td>The CIDR block of the VPC. The CIDR block you specify must exactly match the VPC's CIDR block for information to be returned for the VPC. Type: String Constraints: Must contain the slash followed by one or two digits (for example, /28)</td>
</tr>
<tr>
<td>dhcp-options-id</td>
<td>The ID of a set of DHCP options. Type: String</td>
</tr>
<tr>
<td>state</td>
<td>The state of the VPC. Type: String Valid values: pending</td>
</tr>
<tr>
<td>tag-key</td>
<td>The key of a tag assigned to the resource. This filter is independent of the tag-value filter. For example, if you use both the filter &quot;tag-key=Purpose&quot; and the filter &quot;tag-value=X&quot;, you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the tag: key filter later in this table. For more information about tags, see Tagging Your Resources in the Amazon Elastic Compute Cloud User Guide. Type: String</td>
</tr>
<tr>
<td>tag-value</td>
<td>The value of a tag assigned to the resource. This filter is independent of the tag-key filter. Type: String</td>
</tr>
<tr>
<td>tag: key</td>
<td>Filters the response based on a specific tag/value combination. Example: To list just the resources that have been assigned tag Purpose=X, specify: Filter.1.Name=tag:Purpose Filter.1.Value.1=X Example: To list just resources that have been assigned tag Purpose=X OR Purpose=Y, specify: Filter.1.Name=tag:Purpose Filter.1.Value.1=X Filter.1.Value.2=Y</td>
</tr>
<tr>
<td>vpc-id</td>
<td>The ID of the VPC. Type: String</td>
</tr>
</tbody>
</table>

---

### Response Elements

The elements in the following table are wrapped in a DescribeVpcsResponse element.

<table>
<thead>
<tr>
<th>Name</th>

DescribeVpnConnections

Description

Describes one or more of your VPN connections.

Important
We strongly recommend that you use HTTPS when calling this operation because the response contains sensitive cryptographic information for configuring your customer gateway.

For more information about Amazon Virtual Private Cloud and VPN connections, see Adding an IPsec Hardware Virtual Private Gateway to Your VPC in the Amazon Virtual Private Cloud User Guide.

Note
You can get the customer gateway configuration information in a friendly format by using the ec2-describe-vpn-connections command instead. For more information, see ec2-describe-vpn-connections in the Amazon Virtual Private Cloud Command Line Reference.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>VpnConnectionId.n</td>
<td>A VPN connection ID. You can specify more than one in the request.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: Describes your VPN connections</td>
<td></td>
</tr>
<tr>
<td>Filter.n.Name</td>
<td>The name of a filter. See the table in the Supported Filters section for a list of supported filter names.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td>Filter.n.Value.m</td>
<td>A value for the filter. See the table in the Supported Filters section for a list of supported values for each filter.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
</tbody>
</table>

Supported Filters

You can specify filters so that the response includes information for only certain VPN connections. For example, you can use a filter to specify that you're interested in the VPN connections in the pending or available state. You can specify multiple values for a filter. The response includes information for a VPN connection only if it matches at least one of the filter values that you specified.

You can specify multiple filters; for example, specify VPN connections that are associated with a specific virtual private gateway, and the gateway is in the pending or available state. The response includes information for a VPN connection only if it matches all the filters that you specified. If there's no match, no special message is returned, the response is simply empty.

You can use wildcards in a filter value. An asterisk (*) matches zero or more characters, and a question mark (?) matches exactly one character. You can escape special characters using a backslash (\) before the character. For example, a value of \*amazon?\ searches for the literal string *amazon?\.
The following table lists the available filters.

<table>
<thead>
<tr>
<th>Filter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>customer-gateway-configuration</td>
<td>The configuration information for the customer gateway. Type: String</td>
</tr>
<tr>
<td>customer-gateway-id</td>
<td>The ID of a customer gateway associated with the VPN connection. Type: String</td>
</tr>
<tr>
<td>state</td>
<td>The state of the VPN connection. Type: String</td>
</tr>
<tr>
<td></td>
<td>Valid values: pending</td>
</tr>
<tr>
<td>option.static-routes-only</td>
<td>Indicates whether the connection has static routes only. Used for devices that do not support Border Gateway Protocol (BGP). Type: Boolean</td>
</tr>
<tr>
<td>route.destination-cidr-block</td>
<td>The destination CIDR block. This corresponds to the subnet used in a customer data center. Type: String</td>
</tr>
<tr>
<td>bgp-asn</td>
<td>The BGP Autonomous System Number (ASN) associated with a BGP device. Type: Integer</td>
</tr>
<tr>
<td>tag-key</td>
<td>The key of a tag assigned to the resource. This filter is independent of the tag-value filter. For example, if you use both the filter &quot;tag-key= Purpose&quot; and the filter &quot;tag-value=X&quot;, you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag’s key is). If you want to list only resources where Purpose is X, see the tag: key filter later in this table. For more information about tags, see Tagging Your Resources in the Amazon Elastic Compute Cloud User Guide. Type: String</td>
</tr>
<tr>
<td>tag-value</td>
<td>The value of a tag assigned to the resource. This filter is independent of the tag-key filter. Type: String</td>
</tr>
<tr>
<td>tag: key</td>
<td>Filters the response based on a specific tag/value combination. Example: To list just the resources that have been assigned tag Purpose=X, specify: Filter.1.Name=tag:Purpose Filter.1.Value.1=X Example: To list just resources that have been assigned tag Purpose=X OR Purpose=Y, specify: Filter.1.Name=tag:Purpose Filter.1.Value.1=X Filter.1.Value.2=Y</td>
</tr>
<tr>
<td>type</td>
<td>The type of VPN connection. Currently the only supported type is ipsec.1. Type: String</td>
</tr>
<tr>
<td></td>
<td>Valid values: ipsec.1</td>
</tr>
</tbody>
</table>
### Filter Name

<table>
<thead>
<tr>
<th>Filter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>vpn-connection-id</td>
<td>The ID of the VPN connection. Type: String</td>
</tr>
<tr>
<td>vpn-gateway-id</td>
<td>The ID of a virtual private gateway associated with the VPN connection. Type: String</td>
</tr>
</tbody>
</table>

### Response Elements

The elements in the following table are wrapped in a `DescribeVpnConnectionsResponse` element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request. Type: xsd:string</td>
</tr>
<tr>
<td>vpnConnectionSet</td>
<td>A list of VPN connections. Each VPN connection is wrapped in an <code>item</code> element. Type: VpnConnectionType (p. 532)</td>
</tr>
</tbody>
</table>

### Examples

#### Example Request

This example describes the VPN connection with ID `vpn-44a8938f`. The response includes the customer gateway configuration information. Because it's a long set of information, we haven't displayed it here. You can see an example in the topic for `CreateVpnConnection`.

https://ec2.amazonaws.com/?Action=DescribeVpnConnections &VpnConnectionId.1=vpn-44a8938f &AUTHPARAMS

#### Example Response

```xml
<DescribeVpnConnectionsResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
  <requestId>7a62c49f-347e-4fc4-9331-6e8eEXAMPLE</requestId>
  <vpnConnectionSet>
    <item>
      <vpnConnectionId>vpn-44a8938f</vpnConnectionId>
      <state>available</state>
      <CustomerGatewayConfiguration>
        Customer gateway configuration data in escaped XML format...
      </CustomerGatewayConfiguration>
      <type>ipsec.1</type>
      <customerGatewayId>cgw-b4dc3961</customerGatewayId>
      <vpnGatewayId>vgw-8db04f81</vpnGatewayId>
      <tagSet/>
    </item>
  </vpnConnectionSet>
</DescribeVpnConnectionsResponse>
```
Example Request

This example describes any VPN connection you own that is associated with the customer gateway with ID cgw-b4dc3961, and whose state is either pending or available.

https://ec2.amazonaws.com/?Action=DescribeVpnConnections
&Filter.1.Name=customer-gateway-id
&Filter.1.Value.1=cgw-b4dc3961
&Filter.2.Name=state
&Filter.2.Value.1=pending
&Filter.2.Value.2=available
&AUTHPARAMS

Related Operations

DescribeVpnGateways

Description

Describes one or more of your virtual private gateways.

For more information about Amazon Virtual Private Cloud and virtual private gateways, see Adding an IPsec Hardware Virtual Private Gateway to Your VPC in the Amazon Virtual Private Cloud User Guide.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>VpnGatewayId.n</td>
<td>A virtual private gateway ID. You can specify more than one in the request. Type: String Default: Describes your virtual private gateways.</td>
<td>No</td>
</tr>
<tr>
<td>Filter.n.Name</td>
<td>The name of a filter. See the table in the Supported Filters section for a list of supported filter names. Type: String Default: None</td>
<td>No</td>
</tr>
<tr>
<td>Filter.n.Value.m</td>
<td>A value for the filter. See the table in the Supported Filters section for a list of supported values for each filter. Type: String Default: None</td>
<td>No</td>
</tr>
</tbody>
</table>

Supported Filters

You can specify filters so that the response includes information for only certain virtual private gateways. For example, you can use a filter to specify that you're interested in the virtual private gateways in the pending or available state. You can specify multiple values for a filter. The response includes information for a virtual private gateway only if it matches at least one of the filter values that you specified.

You can specify multiple filters; for example, specify virtual private gateways that are in a specific Availability Zone and are in the pending or available state. The response includes information for a virtual private gateway only if it matches all the filters that you specified. If there's no match, no special message is returned, the response is simply empty.

You can use wildcards in a filter value. An asterisk (*) matches zero or more characters, and a question mark (?) matches exactly one character. You can escape special characters using a backslash (\) before the character. For example, a value of \*amazon\?\ searches for the literal string *amazon?\.

The following table lists the available filters.

<table>
<thead>
<tr>
<th>Filter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>attachment.state</td>
<td>The current state of the attachment between the gateway and the VPC. Type: String Valid values: attaching</td>
</tr>
<tr>
<td>Filter Name</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>----------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>attachment.vpc-id</td>
<td>The ID of an attached VPC. Type: String</td>
</tr>
<tr>
<td>availability-zone</td>
<td>The Availability Zone the virtual private gateway is in. Type: String</td>
</tr>
<tr>
<td>state</td>
<td>The state of the virtual private gateway. Type: String</td>
</tr>
<tr>
<td></td>
<td>Valid values: pending</td>
</tr>
<tr>
<td>tag-key</td>
<td>The key of a tag assigned to the resource. This filter is independent of the tag-value filter. For example, if you use both the filter &quot;tag-key=Purpose&quot; and the filter &quot;tag-value=X&quot;, you get any resources assigned both the tag key Purpose (regardless of what the tag's value is), and the tag value X (regardless of what the tag's key is). If you want to list only resources where Purpose is X, see the tag: key filter later in this table. For more information about tags, see Tagging Your Resources in the Amazon Elastic Compute Cloud User Guide. Type: String</td>
</tr>
<tr>
<td>tag-value</td>
<td>The value of a tag assigned to the resource. This filter is independent of the tag-key filter. Type: String</td>
</tr>
<tr>
<td>tag: key</td>
<td>Filters the response based on a specific tag/value combination. Example: To list just the resources that have been assigned tag Purpose=X, specify: Filter.1.Name=tag:Purpose Filter.1.Value.1=X Example: To list just resources that have been assigned tag Purpose=X OR Purpose=Y, specify: Filter.1.Name=tag:Purpose Filter.1.Value.1=X Filter.1.Value.2=Y</td>
</tr>
<tr>
<td>type</td>
<td>The type of virtual private gateway. Currently the only supported type is ipsec.1. Type: String Valid values: ipsec.1</td>
</tr>
<tr>
<td>vpn-gateway-id</td>
<td>The ID of the virtual private gateway. Type: String</td>
</tr>
</tbody>
</table>

**Response Elements**

The elements in the following table are wrapped in a DescribeVpnGatewaysResponse element.
### Examples

#### Example Request

This example gives a description of the virtual private gateway with ID vgw-8db04f81.

https://ec2.amazonaws.com/?Action=DescribeVpnGateways &VpnGatewayId.1=vgw-8db04f81 &AUTHPARAMS

#### Example Response

```xml
<DescribeVpnGatewaysResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
  <requestId>7a62c49f-347e-4fc4-9331-6e8eEXAMPLE</requestId>
  <vpnGatewaySet>
    <item>
      <vpnGatewayId>vgw-8db04f81</vpnGatewayId>
      <state>available</state>
      <type>ipsec.1</type>
      <availabilityZone>us-east-1a</availabilityZone>
      <attachments>
        <item>
          <vpcId>vpc-1a2b3c4d</vpcId>
          <state>attached</state>
        </item>
      </attachments>
      <tagSet/>
    </item>
  </vpnGatewaySet>
</DescribeVpnGatewaysResponse>
```

#### Example Request

This example uses filters to give a description of any virtual private gateway you own that is in the us-east-1a Availability Zone, and whose state is either pending or available.

### DetachInternetGateway

#### Description

Detaches an Internet gateway from a VPC, disabling connectivity between the Internet and the VPC. The VPC must not contain any running instances with Elastic IP addresses.

For more information about Amazon Virtual Private Cloud and Internet gateways, see the Amazon Virtual Private Cloud User Guide.

#### Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>InternetGatewayId</td>
<td>The ID of the Internet gateway. Type: String</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td>VpcId</td>
<td>The ID of the VPC. Type: String</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
</tbody>
</table>

#### Response Elements

The elements in the following table are wrapped in a `DetachInternetGatewayResponse` element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request. Type: xsd:string</td>
</tr>
<tr>
<td>return</td>
<td>Returns true if the request succeeds. Otherwise, returns an error. Type: xsd:boolean</td>
</tr>
</tbody>
</table>

#### Examples

##### Example Request

The example detaches the Internet gateway with ID igw-eaad4883 from the VPC with ID vpc-11ad4878.

```
https://ec2.amazonaws.com/?Action=DetachInternetGateway
&InternetGatewayId=igw-eaad4883
&VpcId=vpc-11ad4878
&AUTHPARAMS
```
Example Response

```xml
<DetachInternetGatewayResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <return>true</return>
</DetachInternetGatewayResponse>
```

DetachNetworkInterface

Description
Detaches a network interface from an instance.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>AttachmentId</td>
<td>The ID of the attachment. Type: String Default: None</td>
<td>Yes</td>
</tr>
<tr>
<td>Force</td>
<td>Set to true to force a detachment. Type: Boolean Default: None</td>
<td>No</td>
</tr>
</tbody>
</table>

Response Elements
The elements in the following table are wrapped in a DetachNetworkInterfaceResponse element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request. Type: xsd:string</td>
</tr>
<tr>
<td>return</td>
<td>Returns true if the request succeeds. Otherwise, returns an error. Type: xsd:boolean</td>
</tr>
</tbody>
</table>

Examples

Example Request
This example detaches an elastic network interface (ENI) eni-attach-d94b09b0.

https://ec2.amazonaws.com/?Action=DetachNetworkInterface &AttachmentId=eni-attach-d94b09b0 &AUTHPARAMS

Example Response

```xml
  <requestId>ce540707-0635-46bc-97da-33a8a362a0e8</requestId>
  <return>true</return>
</DetachNetworkInterfaceResponse>
```

DetachVolume

Description

Detaches an Amazon EBS volume from an instance. Make sure to unmount any file systems on the device within your operating system before detaching the volume. Failure to do so will result in volume being stuck in "busy" state while detaching. For more information about Amazon EBS, see Using Amazon Elastic Block Store in the Amazon Elastic Compute Cloud User Guide.

Note

If an Amazon EBS volume is the root device of an instance, it cannot be detached while the instance is in the "running" state. To detach the root volume, stop the instance first. If the root volume is detached from an instance with an AWS Marketplace product code, then the AWS Marketplace product codes from that volume are no longer associated with the instance.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>VolumeId</td>
<td>The ID of the volume. Type: String Default: None</td>
<td>Yes</td>
</tr>
<tr>
<td>InstanceId</td>
<td>The ID of the instance. Type: String Default: None</td>
<td>No</td>
</tr>
<tr>
<td>Device</td>
<td>The device name. Type: String Default: None</td>
<td>No</td>
</tr>
<tr>
<td>Force</td>
<td>Forces detachment if the previous detachment attempt did not occur cleanly (logging into an instance, unmounting the volume, and detaching normally). This option can lead to data loss or a corrupted file system. Use this option only as a last resort to detach a volume from a failed instance. The instance won't have an opportunity to flush file system caches or file system metadata. If you use this option, you must perform file system check and repair procedures. Type: Boolean Default: None</td>
<td>No</td>
</tr>
</tbody>
</table>

Response Elements

The elements in the following table are wrapped in a DetachVolumeResponse element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request. Type: xsd:string</td>
</tr>
</tbody>
</table>
### Examples

#### Example Request

This example detaches volume `vol-4d826724`.

```plaintext
https://ec2.amazonaws.com/?Action=DetachVolume
&VolumeId=vol-4d826724
&InstanceId=i-6058a509
&AUTHPARAMS
```

#### Example Response

```xml
<_detachVolumeResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <volumeId>vol-4d826724</volumeId>
  <instanceId>i-6058a509</instanceId>
  <device>/dev/sdh</device>
  <status>detaching</status>
  <attachTime>2008-05-08T11:51:50.000Z</attachTime>
</_detachVolumeResponse>
```

DetachVpnGateway

Description

Detaches a virtual private gateway from a VPC. You do this if you're planning to turn off the VPC and not use it anymore. You can confirm a virtual private gateway has been completely detached from a VPC by describing the virtual private gateway (any attachments to the virtual private gateway are also described).

You must wait for the attachment's state to switch to detached before you can delete the VPC or attach a different VPC to the virtual private gateway.

For more information about Amazon Virtual Private Cloud and virtual private gateways, see Adding an IPsec Hardware Virtual Private Gateway to Your VPC in the Amazon Virtual Private Cloud User Guide.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>VpnGatewayId</td>
<td>The ID of the virtual private gateway. Type: String Default: None</td>
<td>Yes</td>
</tr>
<tr>
<td>VpcId</td>
<td>The ID of the VPC. Type: String Default: None</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Response Elements

The elements in the following table are wrapped in an DetachVpnGatewayResponse element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request. Type: xsd:string</td>
</tr>
<tr>
<td>return</td>
<td>Returns true if the request succeeds. Otherwise, returns an error. Type: xsd:boolean</td>
</tr>
</tbody>
</table>

Examples

Example Request

This example detaches the virtual private gateway with ID vgw-8db04f81 from the VPC with VPC ID vpc-1a2b3c4d.

https://ec2.amazonaws.com/?Action=DetachVpnGateway &VpnGatewayId=vgw-8db04f81
Example Response

```xml
<DetachVpnGatewayResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
  <requestId>7a62c49f-347e-4fc4-9331-6e8eEXAMPLE</requestId>
  <return>true</return>
</DetachVpnGatewayResponse>
```

DisableVgwRoutePropagation

Description
Disables a virtual private gateway (VGW) from propagating routes to the routing tables of an Amazon VPC.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>RouteTableId</td>
<td>The ID of the routing table. Type: String Default: None</td>
<td>Yes</td>
</tr>
<tr>
<td>GatewayId</td>
<td>The ID of the virtual private gateway. Type: String Default: None</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Response Elements

The elements in the following table are wrapped in a DisableVgwRoutePropagationResponseType element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request. Type: xsd:string</td>
</tr>
<tr>
<td>return</td>
<td>Returns true if the request succeeds. Otherwise, returns an error. Type: xsd:boolean</td>
</tr>
</tbody>
</table>

Examples

Example Request
This example disables the virtual private gateway vgw-d8e09e8a from automatically propagating routes to the routing table with ID rtb-c98a35a0.

https://ec2.amazonaws.com/?Action=DisableVgwRoutePropagationResponse &RouteTableID=rtb-c98a35a0 &GatewayId=vgw-d8e09e8a &AUTHPARAMS
Example Response

```xml
<DisableVgwRoutePropagationResponse xmlns='http://ec2.amazonaws.com/doc/2012-08-15'/>
  <requestId>4f35a1b2-c2c3-4093-b51f-abb9d7311990</requestId>
  <return>true</return>
</DisableVgwRoutePropagationResponse>
```

Related Operations

- EnableVgwRoutePropagation (p. 340)
DisassociateAddress

**Description**

Disassociates an Elastic IP address from the instance it's assigned to.

This action applies to both EC2 Elastic IP addresses and VPC Elastic IP addresses. For information about VPC addresses and how they differ from EC2 addresses, see [Elastic IP Addresses](#) in the *Amazon Virtual Private Cloud User Guide*.

This is an idempotent action. If you enter it more than once, Amazon EC2 does not return an error.

**Request Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
</table>
| **PublicIp**  | The EC2 Elastic IP address. Type: String  
Default: None  
Condition: Required for EC2 Elastic IP addresses      | Conditional  |
| **AssociationId** | The association ID corresponding to the VPC Elastic IP address. Type: String     
Default: None  
Condition: Required for VPC Elastic IP addresses       | Conditional  |

**Response Elements**

The elements in the following table are wrapped in a *DisassociateAddressResponse* element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request. Type: xsd:string</td>
</tr>
<tr>
<td>return</td>
<td>Returns true if the request succeeds. Otherwise, returns an error. Type: xsd:boolean</td>
</tr>
</tbody>
</table>

**Examples**

**Example Request**

This example disassociates the EC2 Elastic IP address 67.202.55.255 from the instance to which it is assigned.
Example Request

This example disassociates the VPC Elastic IP address with association ID eipassoc-aa7486c3 from the VPC instance to which it is assigned.

```
https://ec2.amazonaws.com/?Action=DisassociateAddress
&AssociationID=eipassoc-aa7486c3
&AUTHPARAMS
```

Example Response

```
<DisassociateAddressResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <return>true</return>
</DisassociateAddressResponse>
```

DisassociateRouteTable

Description

Disassociates a subnet from a route table.

After you perform this action, the subnet no longer uses the routes in the route table. Instead, it uses the routes in the VPC's main route table. For more information about route tables, see Route Tables in the Amazon Virtual Private Cloud User Guide.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>AssociationId</td>
<td>The association ID representing the current association between the route table and subnet. Type: String Default: None</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Response Elements

The elements in the following table are wrapped in a DisassociateRouteTableResponse element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request. Type: xsd:string</td>
</tr>
<tr>
<td>return</td>
<td>Returns true if the request succeeds. Otherwise, returns an error. Type: xsd:boolean</td>
</tr>
</tbody>
</table>

Examples

Example Request

This example disassociates the route table with association ID rtbassoc-fdad4894 from the subnet it's associated to.

https://ec2.amazonaws.com/?Action=DisassociateRouteTable &AssociationId=rtbassoc-fdad4894 &AUTHPARAMS

EnableVgwRoutePropagation

Description

Enables a virtual private gateway (VGW) to propagate routes to the routing tables of an Amazon VPC.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
</table>
| RouteTableId | The ID of the routing table. Type: String  
|            | Default: None                                   | Yes      |
| GatewayId   | The ID of the virtual private gateway. Type: String  
|            | Default: None                                   | Yes      |

Response Elements

The elements in the following table are wrapped in an EnableVgwRoutePropagationResponseType element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request. Type: xsd:string</td>
</tr>
<tr>
<td>return</td>
<td>Returns true if the request succeeds. Otherwise, returns an error. Type: xsd:boolean</td>
</tr>
</tbody>
</table>

Examples

Example Request

This example enables the virtual private gateway vgw-d8e09e8a to automatically propagate routes to the routing table with ID rtb-c98a35a0.

GetConsoleOutput

Description

Retrieves console output for the specified instance.

Instance console output is buffered and posted shortly after instance boot, reboot, and termination. Amazon EC2 preserves the most recent 64 KB output which will be available for at least one hour after the most recent post.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>InstanceId</td>
<td>The ID of the instance.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
</tbody>
</table>

Response Elements

The elements in the following table are wrapped in a GetConsoleOutputResponse element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request.</td>
</tr>
<tr>
<td></td>
<td>Type: xsd:string</td>

GetPasswordData

Description

Retrieves the encrypted administrator password for an instance running Windows.

Note
The Windows password is only generated the first time an AMI is launched. It is not generated for rebundled AMIs or after the password is changed on an instance.
The password is encrypted using the key pair that you provided.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
</table>
| InstanceId | A Windows instance ID.  
  Type: String  
  Default: None | Yes      |

Response Elements

The elements in the following table are wrapped in a GetPasswordDataResponse element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| requestId  | The ID of the request.  
  Type: xsd:string |           |
| instanceId | The ID of the instance.  
  Type: xsd:string |           |
| timestamp  | The time the data was last updated.  
  Type: xsd:dateTime |           |
| passwordData | The password of the instance.  
  Type: xsd:string |           |

Examples

Example Request

This example returns the encrypted version of the administrator password for the i-2574e22a instance.

https://ec2.amazonaws.com/?Action=GetPasswordData
&InstanceId=i-10a64379
&AUTHPARAMS
Example Response

```xml
<GetPasswordDataResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>

## ImportInstance

### Description

Creates a new import instance task using metadata from the specified disk image. After importing the image, you then upload it using the `ec2-upload-disk-image` command in the EC2 command line tools. For more information, see Using the Command Line Tools to Import Your Virtual Machine to Amazon EC2 in the Amazon Elastic Compute Cloud User Guide.

### Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>A description of the instance being imported. Type: String Default: None</td>
<td>No</td>
</tr>
<tr>
<td>LaunchSpecification.Architecture</td>
<td>The architecture of the instance. Type: String Default: None Valid values: i386</td>
<td>Yes</td>
</tr>
<tr>
<td>LaunchSpecification.GroupName.n</td>
<td>One or more security group names. Type: String Default: None</td>
<td>No</td>
</tr>
<tr>
<td>LaunchSpecification.UserData</td>
<td>User data to be made available to the instance. Type: String Default: None</td>
<td>No</td>
</tr>
<tr>
<td>LaunchSpecification.InstanceType</td>
<td>The instance type. Type: String Valid values: m1.small</td>
<td>Yes</td>
</tr>
<tr>
<td>LaunchSpecification.Placement.AvailabilityZone</td>
<td>The Availability Zone to launch the instance into. Type: String Default: EC2 chooses a zone for you</td>
<td>No</td>
</tr>
<tr>
<td>LaunchSpecification.Monitoring.Enabled</td>
<td>Specifies whether to enable detailed monitoring for the instance. Type: Boolean Default: false</td>
<td>No</td>
</tr>
<tr>
<td>LaunchSpecification.SubnetId</td>
<td>If you're using Amazon Virtual Private Cloud, this specifies the ID of the subnet you want to launch the instance into. Type: String Default: None</td>
<td>No</td>
</tr>
</tbody>
</table>

API Version 2012-10-01
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>LaunchSpecification.InstanceInitiatedShutdownBehavior</code></td>
<td>Specifies whether the instance stops or terminates on instance-initiated shutdown. Type: String Valid values: `stop</td>
<td>terminate<code>Default:</code>stop`</td>
</tr>
<tr>
<td><code>LaunchSpecification.PrivateIpAddress</code></td>
<td>If you're using Amazon Virtual Private Cloud, you can optionally use this parameter to assign the instance a specific available IP address from the subnet (e.g., 10.0.0.25). Type: String Default: Amazon VPC selects an IP address from the subnet for the instance</td>
<td>No</td>
</tr>
<tr>
<td><code>DiskImage.n.Image.Format</code></td>
<td>The file format of the disk image. Type: String Default: None Valid values: `VMDK</td>
<td>RAW</td>
</tr>
<tr>
<td><code>DiskImage.n.Image.Bytes</code></td>
<td>The number of bytes in the disk image. Type: Long Default: None</td>
<td>Yes</td>
</tr>
<tr>
<td><code>DiskImage.n.Image.ImportManifestUrl</code></td>
<td>The manifest for the disk image, stored in Amazon S3 and presented here as an Amazon S3 presigned URL. For information about creating a presigned URL for an Amazon S3 object, read the “Signing and Authenticating REST Requests” section of the Signing and Authenticating REST Requests topic in the Amazon Simple Storage Service Developer Guide. Type: String Default: None</td>
<td>Yes</td>
</tr>
<tr>
<td><code>DiskImage.n.Image.Description</code></td>
<td>An optional description of the disk image. Type: String Default: None</td>
<td>No</td>
</tr>
<tr>
<td><code>DiskImage.n.Volume.Size</code></td>
<td>The size, in GB (2^30 bytes), of the Amazon EBS volume that will hold the converted image. Type: Integer Default: None</td>
<td>Yes</td>
</tr>
<tr>
<td><code>Platform</code></td>
<td>The EC2 instance operating system. Type: String Default: None Valid value: <code>Windows</code></td>
<td>No</td>
</tr>
</tbody>
</table>

**Response Elements**

The elements in the following table are wrapped in an `ImportInstanceResponse` element.
### Examples

#### Example Request

This example creates an import instance task that migrates a Windows Server 2008 SP2 (32-bit) VM into the AWS us-east-1 region.

```xml
https://ec2.amazonaws.com/?Action=ImportInstance
&LaunchSpecification.Architecture=x86_64
&LaunchSpecification.InstanceType=m1.xlarge
&DiskImage.1.Image.Format=VMDK
&DiskImage.1.Image.Bytes=1179593728
&DiskImage.1.Image.ImportManifestUrl=https://s3.amazonaws.com/myawsbucket/a3a5e1b6-590d-43cc-97c1-15c7325d3f41/Win_2008_Server_Data_Center_SP2_32-bit.vmdkmanifest.xml?AWSAccessKeyId=AKIAIOSFODNN7EXAMPLE&Expires=1294855591&Signature=5snej01T1Tl0uR7KExtEXAMPE%3D
&DiskImage.1.Volume.Size=12
&Platform=Windows
&AUTHPARAMS
```

#### Example Response

```xml
<ImportInstanceResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
  <conversionTask>
    <conversionTaskId>import-i-ffvko9js</conversionTaskId>
    <expirationTime>2010-12-22T12:01Z</expirationTime>
    <importInstance>
      <volumes>
        <item>
          <bytesConverted>0</bytesConverted>
          <availabilityZone>us-east-1a</availabilityZone>
          <image>
            <format>VMDK</format>
            <size>1179593728</size>
            <importManifestUrl>
              https://s3.amazonaws.com/myawsbucket/a3a5e1b6-590d-43cc-97c1-15c7325d3f41/Win_2008_Server_Data_Center_SP2_32-bit.vmdkmanifest.xml?AWSAccessKeyId=AKIAIOSFODNN7EXAMPLE&Expires=1294855591&Signature=5snej01T1Tl0uR7KExtEXAMPE%3D
            </importManifestUrl>
          </image>
        </item>
      </volumes>
      <status>active</status>
    </importInstance>
  </conversionTask>
</ImportInstanceResponse>
```

ImportKeyPair

Description

Imports the public key from an RSA key pair that you created with a third-party tool. Compare this with CreateKeyPair, in which AWS creates the key pair and gives the keys to you (AWS keeps a copy of the public key). With ImportKeyPair, you create the key pair and give AWS just the public key. The private key is never transferred between you and AWS.

You can easily create an RSA key pair on Windows and Linux using the ssh-keygen command line tool (provided with the standard OpenSSH installation). Standard library support for RSA key pair creation is also available in Java, Ruby, Python, and many other programming languages.

Supported formats:

- OpenSSH public key format (e.g., the format in ~/.ssh/authorized_keys)
- Base64 encoded DER format
- SSH public key file format as specified in RFC4716

DSA keys are not supported. Make sure your key generator is set up to create RSA keys.

Supported lengths: 1024, 2048, and 4096.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>KeyName</td>
<td>A unique name for the key pair.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td>PublicKeyMaterial</td>
<td>The public key. You must base64 encode the public key material before sending it to AWS.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
</tbody>
</table>

Response Elements

The elements in the following table are wrapped in an ImportKeyPairResponse element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request.</td>

ModifyImageAttribute

Description

Modifies an attribute of an AMI.

Note
AWS Marketplace product codes cannot be modified. Images with an AWS Marketplace product code cannot be made public.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>ImageId</td>
<td>The AMI ID. Type: String. Default: None</td>
<td>Yes</td>
</tr>
<tr>
<td>LaunchPermission.Add.n.UserId</td>
<td>Adds the specified AWS account ID to the AMI's list of launch permissions. Type: String. Default: None</td>
<td>No</td>
</tr>
<tr>
<td>LaunchPermission.Remove.n.UserId</td>
<td>Removes the specified AWS account ID from the AMI's list of launch permissions. Type: String. Default: None</td>
<td>No</td>
</tr>
<tr>
<td>LaunchPermission.Add.n.Group</td>
<td>Adds the specified group to the image's list of launch permissions. The only valid value is all. Type: String. Valid value: all (for all EC2 users). Default: None</td>
<td>No</td>
</tr>
<tr>
<td>LaunchPermission.Remove.n.Group</td>
<td>Removes the specified group from the image's list of launch permissions. The only valid value is all. Type: String. Valid value: all (for all EC2 users). Default: None</td>
<td>No</td>
</tr>
<tr>
<td>ProductCode.n</td>
<td>Adds the specified product code to the specified instance store-backed AMI. After you add a product code to an AMI, it can't be removed. Type: String. Default: None</td>
<td>No</td>

<tr>
<td>return</td>
<td>Returns <code>true</code> if successful. Otherwise, returns an error. Type: <code>xsd:boolean</code></td>
</tr>
</tbody>
</table>

Examples

Example Request

This example makes the AMI public (i.e., so any AWS account can launch it).

https://ec2.amazonaws.com/?Action=ModifyImageAttribute
&ImageId=ami-61a54008
&LaunchPermission.Add.1.Group=all
&AUTHPARAMS

Example Request

This example makes the AMI private (i.e., so only you as the owner can launch it).

https://ec2.amazonaws.com/?Action=ModifyImageAttribute
&ImageId=ami-61a54008
&LaunchPermission.Remove.1.Group=all
&AUTHPARAMS

Example Request

This example grants launch permission to the AWS account with ID 111122223333.

https://ec2.amazonaws.com/?Action=ModifyImageAttribute
&ImageId=ami-61a54008
&LaunchPermission.Add.1.UserId=111122223333
&AUTHPARAMS

Example Request

This example removes launch permission from the AWS account with ID 111122223333.

https://ec2.amazonaws.com/?Action=ModifyImageAttribute
&ImageId=ami-61a54008
&LaunchPermission.Remove.1.UserId=111122223333
&AUTHPARAMS
Example Request

This example adds the 774F4FF8 product code to the ami-61a54008 AMI.

https://ec2.amazonaws.com/?Action=ModifyImageAttribute
&ImageId=ami-61a54008
&ProductCode.1=774F4FF8
&AUTHPARAMS

Example Request

This example changes the description of the AMI to New_Description

https://ec2.amazonaws.com/?Action=ModifyImageAttribute
&ImageId=ami-61a54008
&Description.Value=New_Description
&AUTHPARAMS

Example Response

<ModifyImageAttributeResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
  <return>true</return>
</ModifyImageAttributeResponse>

Related Operations

<tr>
<td>InstanceType.Value</td>
<td>Changes the instance type to the specified value. Type: String Default: None</td>
<td>No</td>
</tr>
<tr>
<td>Kernel.Value</td>
<td>Changes the instance's kernel to the specified value. Type: String Default: None</td>
<td>No</td>
</tr>
<tr>
<td>Ramdisk.Value</td>
<td>Changes the instance's RAM disk to the specified value. Type: String Default: None</td>
<td>No</td>
</tr>
<tr>
<td>UserData.Value</td>
<td>Changes the instance's user data to the specified value. Type: String Default: None</td>
<td>No</td>
</tr>
<tr>
<td>DisableApiTermination.Value</td>
<td>Changes the instance's DisableApiTermination flag to the specified value. A value of true means you can't terminate the instance using the API (i.e., the instance is &quot;locked&quot;); a value of false means you can. You must modify this attribute before you can terminate any &quot;locked&quot; instances using the API. Type: Boolean Default: None</td>
<td>No</td>
</tr>
<tr>
<td>InstanceInitiatedShutdownBehavior.Value</td>
<td>Changes the instance's InstanceInitiatedShutdownBehavior flag to the specified value. Type: String Default: None Valid values: stop</td>
<td>No</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Required</td>
</tr>
<tr>
<td>------</td>
<td>-------------</td>
<td>----------</td>
</tr>
</tbody>
</table>
| BlockMappingDevice.Value | Modifies the DeleteOnTermination attribute for volumes that are currently attached. The volume must be owned by the caller. If no value is specified for DeleteOnTermination, the value defaults to true and the volume is deleted when the instance is terminated. **Note** To add instance store volumes to an Amazon EBS-backed instance, you must add them when you launch the instance. For more information, see Updating the Block Device Mapping when Launching an Instance in the Amazon Elastic Compute Cloud User Guide. Type: InstanceBlockDeviceMappingItemType (p. 474) Default: None Example:  
```xml
<BlockDeviceMapping1.DeviceName=/dev/sdh
 &BlockDeviceMapping.1.Ebs.DeleteOnTermination=true
```
| SourceDestCheck.Value | Enables a Network Address Translation (NAT) instance in a VPC to perform NAT. The attribute controls whether source/destination checking is enabled on the instance. A value of true means checking is enabled, and false means checking is disabled. The value must be false for the instance to perform NAT. For more information, see NAT Instances in the Amazon Virtual Private Cloud User Guide. Type: Boolean Default: None | No |
| GroupId.n | For instances running in a VPC: Changes the security groups that an instance is in. The new set of groups you specify replaces the current set. You must specify at least one group, even if it's just the default security group in the VPC. You must specify the group ID and not the group name. For example, if you want the instance to be in sg-1a1a1a1a and sg-9b9b9b9b, specify GroupId.1=sg-1a1a1a1a and GroupId.2=sg-9b9b9b9b. Type: String Default: None | No |
| EbsOptimized | Whether the instance is optimized for EBS I/O. This optimization provides dedicated throughput to Amazon EBS and an optimized configuration stack to provide optimal EBS I/O performance. This optimization isn’t available with all instance types. Additional usage charges apply when using an EBS Optimized instance. Type: Boolean Default: false | No |
Response Elements

The elements in the following table are wrapped in a ModifyInstanceAttributeResponse element.

ModifySnapshotAttribute

Description

Adds or remove permission settings for the specified snapshot.

Note
Snapshots with AWS Marketplace product codes cannot be made public.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>SnapshotId</td>
<td>The ID of the snapshot. Type: String Default: None</td>
<td>Yes</td>
</tr>
<tr>
<td>CreateVolumePermission.Add.n.UserId</td>
<td>Adds the specified AWS account ID to the volume's list of create volume permissions. Type: String Default: None</td>
<td>Yes</td>
</tr>
<tr>
<td>CreateVolumePermission.Add.n.Group</td>
<td>Adds the specified group to the volume's list of create volume permissions. The only valid value is all. Type: String Default: None</td>
<td>Yes</td>
</tr>
<tr>
<td>CreateVolumePermission.Remove.n.UserId</td>
<td>Removes the specified AWS account ID from the volume's list of create volume permissions. Type: String Default: None</td>
<td>No</td>
</tr>
<tr>
<td>CreateVolumePermission.Remove.n.Group</td>
<td>Removes the specified group from the volume's list of create volume permissions. Type: String Default: None</td>
<td>No</td>
</tr>
</tbody>
</table>

Response Elements

The elements in the following table are wrapped in a ModifySnapshotAttributeResponse element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request. Type: xsd:string</td>
</tr>
<tr>
<td>return</td>
<td>Returns true if successful. Otherwise, returns an error. Type: xsd:boolean</td>
</tr>
</tbody>
</table>
Examples

Example Request

This example makes the snap-78a54011 snapshot public, and gives the account with ID 111122223333 permission to create volumes from the snapshot.

```plaintext
https://ec2.amazonaws.com/?Action=ModifySnapshotAttribute
&snapshotId=snap-78a54011
&CreateVolumePermission.Add.1.UserId=111122223333
&CreateVolumePermission.Add.1.Group=all
&AUTHPARAMS
```

This example makes the snap-78a54011 snapshot public, and removes the account with ID 111122223333 from the list of users with permission to create volumes from the snapshot.

```plaintext
https://ec2.amazonaws.com/?Action=ModifySnapshotAttribute
&snapshotId=snap-78a54011
&CreateVolumePermission.Remove.1.UserId=111122223333
&CreateVolumePermission.Add.1.Group=all
&AUTHPARAMS
```

Example Response

```xml
<ModifySnapshotAttributeResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <return>true</return>
</ModifySnapshotAttributeResponse>
```

ModifyVolumeAttribute

Description

Modifies a volume attribute.

By default, all I/O operations for the volume are suspended when the data on the volume is determined to be potentially inconsistent, to prevent undetectable, latent data corruption. The I/O access to the volume can be resumed by first calling EnableVolumeIO (p. 342) action to enable I/O access and then checking the data consistency on your volume.

You can change the default behavior to resume I/O operations without calling EnableVolumeIO (p. 342) action by setting the AutoEnableIO attribute of the volume to true. We recommend that you change this attribute only for volumes that are stateless, or disposable, or for boot volumes.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>VolumeId</td>
<td>The ID of the volume. Type: String</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td>AutoEnableIO.Value</td>
<td>This attribute exists to auto-enable the I/O operations to the volume. Type: Boolean</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Default: false</td>
<td></td>
</tr>
</tbody>
</table>

Response Elements

The elements in the following table are wrapped in a ModifyVolumeAttributeResponse element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request. Type: xsd:string</td>
</tr>
<tr>
<td>return</td>
<td>Returns true if the auto-enable of the specified volume is enabled. Type: xsd:boolean</td>
</tr>
</tbody>
</table>

Examples

Example Request

This example modifies the attribute of the volume vol-12345678

https://ec2.amazonaws.com/?Action=ModifyVolumeAttribute&VolumeId=vol-12345678
Example Response

```
<ModifyVolumeAttributeResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
  <requestId>5jkdf074-37ed-4004-8671-a78ee82bf1cbEXAMPLE</requestId>
  <return>true</return>
</ModifyVolumeAttributeResponse>
```

MonitorInstances

Description

Enables monitoring for a running instance. For more information about monitoring instances, see Monitoring Your Instances and Volumes in the Amazon Elastic Compute Cloud User Guide.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>InstanceId.n</td>
<td>One or more instance IDs.</td>
<td>Yes</td>
</tr>
<tr>
<td>Type: String</td>
<td>Default: None</td>
<td></td>
</tr>
</tbody>
</table>

Response Elements

The elements in the following table are wrapped in a MonitorInstancesResponse element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request. Type: xsd:string</td>
</tr>
<tr>
<td>instancesSet</td>
<td>A list of instances. Each instance is wrapped in an item element. Type:</td>
</tr>
<tr>
<td></td>
<td>MonitorInstancesResponseSetItemType (p. 494)</td>
</tr>
</tbody>
</table>

Examples

Example Request

This example enables monitoring for i-43a4412a and i-23a3397d.

https://ec2.amazonaws.com/?Action=MonitorInstances
&InstanceId.1=i-43a4412a
&InstanceId.2=i-23a3397d
&AUTHPARAMS

Example Response

<MonitorInstancesResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <instancesSet>
    <item>
      <instanceId>i-43a4412a</instanceId>
      <monitoring>
        <state>pending</state>
      </monitoring>
    </item>
  </instancesSet>
</MonitorInstancesResponse>

PurchaseReservedInstancesOffering

Description

Purchases a Reserved Instance for use with your account. With Amazon EC2 Reserved Instances, you obtain a capacity reservation for a certain instance configuration over a specified period of time. You pay a lower usage rate than with On-Demand instances for the time that you actually use the capacity reservation.

Starting with the 2011-11-01 API version, AWS expanded its offering of Reserved Instances to address a range of projected instance usage. There are three types of Reserved Instances based on customer utilization levels: Heavy Utilization, Medium Utilization, and Light Utilization.

The Medium Utilization offering type is equivalent to the Reserved Instance offering available before API version 2011-11-01. If you are using tools that predate the 2011-11-01 API version, DescribeReservedInstancesOfferings will only list information about the Medium Utilization Reserved Instance offering type.

For information about Reserved Instance Pricing Tiers, go to Understanding Reserved Instance Pricing Tiers in the Amazon Elastic Compute Cloud User Guide. For more information about Reserved Instances, go to Reserved Instances also in the Amazon Elastic Compute Cloud User Guide.

You determine the type of the Reserved Instances offerings by including the optional offeringType parameter when calling DescribeReservedInstancesOfferings. After you've identified the Reserved Instance with the offering type you want, specify its ReservedInstancesOfferingId when you call PurchaseReservedInstancesOffering.

Starting with the 2012-08-15 API version, you can also purchase Reserved Instances from the Reserved Instance Marketplace. The Reserved Instance Marketplace matches sellers who want to resell Reserved Instance capacity that they no longer need with buyers who want to purchase additional capacity. Reserved Instances bought and sold through the Reserved Instance Marketplace work like any other Reserved Instances.

By default, with the 2012-08-15 API version, DescribeReservedInstancesOfferings returns information about Amazon EC2 Reserved Instances available directly from AWS, plus instance offerings available on the Reserved Instance Marketplace. If you are using tools that predate the 2012-08-15 API version, the DescribeReservedInstancesOfferings action will only list information about Amazon EC2 Reserved Instances available directly from AWS.

For more information about the Reserved Instance Marketplace, go to Reserved Instance Marketplace in the Amazon Elastic Compute Cloud User Guide.

You determine the Reserved Instance Marketplace offerings by specifying true for the optional includeMarketplace parameter when calling DescribeReservedInstancesOfferings. After you've identified the Reserved Instance with the offering type you want, specify its reservedInstancesOfferingId when you call PurchaseReservedInstancesOffering.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>reservedInstancesOfferingId</td>
<td>ID of the Reserved Instance offering you want to purchase. Type: String</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
</tbody>
</table>
### Required Description

**Name**: `instanceCount`

- **Description**: The number of Reserved Instances to purchase.  
  - Type: Integer  
  - Default: None

- **Name**: `limitPrice`

- **Description**: Specified for Reserved Instance Marketplace offerings to limit the total order and ensure that the Reserved Instances are not purchased at unexpected prices.  
  - Type: `ReservedInstanceLimitPriceType` (p. 510)

### Response Elements

The elements in the following table are wrapped in a `PurchaseReservedInstancesOfferingResponse` element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| requestId           | The ID of the request.  
  - Type: xsd:string                                                                 |
| reservedInstancesId | The IDs of the purchased Reserved Instances.  
  - Type: xsd:string                                                                 |

### Examples

**Set the limit price for Reserved Instance Marketplace purchase**

This example uses `LimitPrice` to limit the total purchase order of Reserved Instances from Reserved Instance Marketplace.

```xml
https://ec2.amazonaws.com/?Action=PurchaseReservedInstancesOffering  
&ReservedInstancesOfferingId=4b2293b4-5813-4cc8-9ce3-1957fc1dcfc8  
&LimitPrice.Amount=200  
&InstanceCount=2  
&AUTHPARAMS
```

The response looks like the following example.

```xml
<PurchaseReservedInstancesOfferingResponse xmlns="http://ec2.amazonaws.com/doc/2012-08-15/">  
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>  
  <reservedInstancesId>af9f760e-clcl-449b-8128-1342d3a6927a</reservedInstancesId>  
</PurchaseReservedInstancesOfferingResponse>
```
Example Request

This example illustrates a purchase of a Reserved Instances offering.

https://ec2.amazonaws.com/?Action=PurchaseReservedInstancesOffering
&ReservedInstancesOfferingId=4b2293b4-5813-4cc8-9ce3-1957fc1d6c8
&InstanceCount=2
&AUTHPARAMS

Example Response

<PurchaseReservedInstancesOfferingResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <reservedInstancesId>af9f760e-clcl-449b-8128-1342d3a6927a</reservedInstancesId>
</PurchaseReservedInstancesOfferingResponse>

RebootInstances

Description

Requests a reboot of one or more instances. This operation is asynchronous; it only queues a request to reboot the specified instance(s). The operation will succeed if the instances are valid and belong to you. Requests to reboot terminated instances are ignored.

Note

If a Linux/UNIX instance does not cleanly shut down within four minutes, Amazon EC2 will perform a hard reboot.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>InstanceId.n</td>
<td>One or more instance IDs.</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
</tbody>
</table>

Response Elements

The elements in the following table are wrapped in a RebootInstancesResponse element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request.</td>
</tr>
<tr>
<td></td>
<td>Type: xsd:string</td>
</tr>
<tr>
<td>return</td>
<td>Returns true if successful. Otherwise, returns an error.</td>
</tr>
<tr>
<td></td>
<td>Type: xsd:boolean</td>
</tr>
</tbody>
</table>

Examples

Example Request

This example reboots two instances.

https://ec2.amazonaws.com/?Action=RebootInstances
&InstanceId.1=i-1a2b3c4d
&InstanceId.2=i-4d3acf62
&AUTHPARAMS

Example Response

<RebootInstancesResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
</RebootInstancesResponse>
<return>true</return>
</RebootInstancesResponse>

Related Operations

- RunInstances (p. 417)
RegisterImage

Description

Registers a new AMI with Amazon EC2. When you’re creating an AMI, this is the final step you must complete before you can launch an instance from the AMI. For more information about creating AMIs, see Creating Your Own AMIs in the Amazon Elastic Compute Cloud User Guide.

Note

For Amazon EBS-backed instances, the CreateImage operation creates and registers the AMI in a single request, so you don’t have to register the AMI yourself.

You can also use the RegisterImage action to create an EBS-backed AMI from a snapshot of a root device volume. For more information, see Launching an Instance from a Snapshot in the Amazon Elastic Compute Cloud User Guide.

If needed, you can deregister an AMI at any time. Any modifications you make to an AMI backed by instance store invalidates its registration. If you make changes to an image, deregister the previous image and register the new image.

Note

You cannot register an image where a secondary (non-root) snapshot has AWS Marketplace product codes.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>ImageLocation</td>
<td>The full path to your AMI manifest in Amazon S3 storage. Type: String</td>
<td>Conditional</td>
</tr>
<tr>
<td>Name</td>
<td>A name for your AMI. Type: String Default: None Constraints: 3-128 alphanumeric characters, parenthesis (()), commas (,), slashes (/), dashes (-), or underscores (_)</td>
<td>Yes</td>
</tr>
<tr>
<td>Description</td>
<td>A description of the AMI. Type: String Default: None Constraints: Up to 255 characters.</td>
<td>No</td>
</tr>
<tr>
<td>Architecture</td>
<td>The architecture of the image. Type: String Valid values: i386</td>
<td>x86_64  Default: i386 for Amazon EBS-backed AMIs. Instance store-backed AMIs try to use the architecture specified in the manifest file.</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Required</td>
</tr>
<tr>
<td>---------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>-----------</td>
</tr>
</tbody>
</table>
| **KernelId**        | The ID of the kernel. Type: String  
Default: None                                                                                                                                   | No        |
| **RamdiskId**       | The ID of the RAM disk. Some kernels require additional drivers at launch. Check the kernel requirements for information on whether you need to specify a RAM disk. To find kernel requirements, refer to the Resource Center and search for the kernel ID.  
Type: String  
Default: None                                                                 | No        |
| **RootDeviceName**  | The name of the root device (for example, /dev/sda1, or xvda).  
Type: String  
Default: None  
Condition: Required if registering an Amazon EBS-backed AMI                                                                                   | Conditional |
| **BlockDeviceMapping.n.DeviceName** | The device name exposed to the instance (for example, /dev/sdh or xvdh). For more information, see Block Device Mapping.  
Type: String  
Default: None  
Condition: If you’re registering an Amazon EBS-backed AMI from a snapshot, you must specify DeviceName with the root device name (for example, /dev/sda1 or xvda), and BlockDeviceMapping.n.Ebs.SnapshotId with the snapshot ID | Conditional |
| **BlockDeviceMapping.n.NoDevice** | Suppresses a device mapping.  
Type: Boolean  
Default: true                                                                                                                                   | No        |
| **BlockDeviceMapping.n.VirtualName** | The name of the virtual device, ephemeral[0..3]. The number of instance store volumes depends on the instance type.  
Type: String  
Default: None                                                                                                                                   | No        |
| **BlockDeviceMapping.n.Ebs.SnapshotId** | The ID of the snapshot.  
Type: String  
Default: None  
Condition: If you’re registering an Amazon EBS-backed AMI from a snapshot, you must at least specify SnapshotId with the snapshot ID, and BlockDeviceMapping.n.DeviceName with the root device name. | Conditional |
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
</table>
| `BlockDeviceMapping.n.Ebs.VolumeSize` | The size of the volume, in GiBs. Type: Integer  
Valid values: If the volume type is `io1`, the minimum size of the volume is 10 GiB.  
Default: If you're creating the volume from a snapshot and don't specify a volume size, the default is the snapshot size.  
Condition: Required unless you're creating the volume from a snapshot. | Conditional |
| `BlockDeviceMapping.n.Ebs.DeleteOnTermination` | Whether the volume is deleted on instance termination. Type: Boolean  
Default: true | No |
| `BlockDeviceMapping.n.Ebs.VolumeType` | The volume type. Type: String  
Valid values: `standard` | No |
| `BlockDeviceMapping.n.Ebs.Iops` | The number of I/O operations per second (IOPS) that the volume supports. Type: Integer  
Valid values: Range is 100 to 2000. Default: None  
Condition: Required when the volume type is `io1`; not used with `standard` volumes. | Conditional |

### Response Elements

The elements in the following table are wrapped in a `RegisterImageResponse` element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request. Type: xsd:string</td>
</tr>
<tr>
<td>imageId</td>
<td>The ID of the newly registered AMI. Type: xsd:string</td>
</tr>
</tbody>
</table>

### Examples

#### Example Request

This example registers the AMI specified in the `my-new-image.manifest.xml` manifest file, located in the bucket called `myawsbucket`.
Example Request

This example registers an Amazon EBS snapshot to create an AMI backed by Amazon EBS.

```
https://ec2.amazonaws.com/?Action=RegisterImage
&RootDeviceName=/dev/sda1
&BlockDeviceMapping.1.DeviceName=/dev/sda1
&BlockDeviceMapping.1.Ebs.SnapshotId=snap-6eba6e06
&Name=MyImage
&AUTHPARAMS
```

Example Request

This example registers the AMI with an Amazon EBS snapshot as the root device, a separate snapshot as a secondary device, and an empty 100 GiB Amazon EBS volume as a storage device.

```
https://ec2.amazonaws.com/?Action=RegisterImage
&RootDeviceName=/dev/sda1
&BlockDeviceMapping.1.DeviceName=/dev/sda1
&BlockDeviceMapping.1.Ebs.SnapshotId=snap-6eba6e06
&BlockDeviceMapping.2.DeviceName=/dev/sdb
&BlockDeviceMapping.2.Ebs.SnapshotId=snap-823ea6df
&BlockDeviceMapping.3.DeviceName=/dev/sdc
&BlockDeviceMapping.3.Ebs.VolumeSize=100
&Name=MyImage
&AUTHPARAMS
```

Example Response

```
<RegisterImageResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <imageId>ami-78a54043</imageId>
</RegisterImageResponse>
```

ReleaseAddress

Description

Releases an Elastic IP address allocated to your account.

**Important**
After releasing an Elastic IP address, it is released to the IP address pool and might be unavailable to your account. Make sure to update your DNS records and any servers or devices that communicate with the address.

This action applies to both EC2 and VPC Elastic IP addresses. For information about how these Elastic IP addresses differ, see Elastic IP Addresses in the Amazon Virtual Private Cloud User Guide.

EC2: Releasing an Elastic IP address automatically disassociates it from any instance that it's associated with. To disassociate an IP address without releasing it, use the `DisassociateAddress` action.

VPC: Releasing an Elastic IP address that's associated with an instance causes Amazon EC2 to return an `InvalidIPAddress.InUse` error.

If you run this action on an Elastic IP address that is already released, the address might be assigned to another account, which causes Amazon EC2 to return an `AuthFailure` error.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>PublicIp</td>
<td>The EC2 Elastic IP address. Type: String Default: None Condition: Required for EC2 Elastic IP addresses</td>
<td>Conditional</td>
</tr>
<tr>
<td>AllocationId</td>
<td>The allocation ID that AWS provided when you allocated the address for use with Amazon VPC. Type: String Default: None Condition: Required for VPC Elastic IP addresses</td>
<td>Conditional</td>
</tr>
</tbody>
</table>

Response Elements

The elements in the following table are wrapped in a `ReleaseAddressResponse` element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request. Type: xsd:string</td>
</tr>
<tr>
<td>return</td>
<td>Returns <code>true</code> if successful. Otherwise, returns an error. Type: xsd:boolean</td>
</tr>
</tbody>
</table>
Examples

Example Request

This example releases an EC2 Elastic IP address (67.202.55.255).

https://ec2.amazonaws.com/?Action=ReleaseAddress
&PublicIp=192.0.2.1
&AUTHPARAMS

Example Request

This example releases a VPC Elastic IP address with allocation ID eipalloc-5723d13e.

https://ec2.amazonaws.com/?Action=ReleaseAddress
&AllocationId=eipalloc-5723d13e
&AUTHPARAMS

Example Response

<ReleaseAddressResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <return>true</return>
</ReleaseAddressResponse>

ReplaceNetworkAclAssociation

Description

Changes which network ACL a subnet is associated with. By default when you create a subnet, it's automatically associated with the default network ACL. For more information about network ACLs, see Network ACLs in the Amazon Virtual Private Cloud User Guide.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>AssociationId</td>
<td>The ID representing the current association between the original network ACL and the subnet. Type: String Default: None</td>
<td>Yes</td>
</tr>
<tr>
<td>NetworkAclId</td>
<td>The ID of the new ACL to associate with the subnet. Type: String Default: None</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Response Elements

The elements in the following table are wrapped in a ReplaceNetworkAclAssociationResponse element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request. Type: xsd:string</td>
</tr>
<tr>
<td>newAssociationId</td>
<td>The ID of the new association. Type: xsd:string</td>
</tr>
</tbody>
</table>

Examples

Example Request

This example starts with a network ACL associated with a subnet, and a corresponding association ID aclassoc-e5b95c8c. You want to associate a different network ACL (acl-5fb85d36) with the subnet. The result is a new association ID representing the new association.

https://ec2.amazonaws.com/?Action=ReplaceNetworkAclAssociation &AssociationId=aclassoc-e5b95c8c &NetworkAclId=acl-5fb85d36 &AUTHPARAMS
Example Response

<ReplaceNetworkAclAssociationResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <newAssociationId>aclassoc-17b85d7e</newAssociationId>
</ReplaceNetworkAclAssociationResponse>

Related Operations

ReplaceNetworkAclEntry

**Description**

Replaces an entry (i.e., rule) in a network ACL. For more information about network ACLs, see Network ACLs in the Amazon Virtual Private Cloud User Guide.

**Request Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>NetworkAclId</td>
<td>The ID of the ACL. Type: String Default: None</td>
<td>Yes</td>
</tr>
<tr>
<td>RuleNumber</td>
<td>The rule number of the entry to replace. Type: Integer Default: None</td>
<td>Yes</td>
</tr>
<tr>
<td>Protocol</td>
<td>The IP protocol the rule applies to. You can use -1 to mean all protocols. Type: Integer Valid values: −1 or a protocol number (go to Protocol Numbers).</td>
<td>Yes</td>
</tr>
<tr>
<td>RuleAction</td>
<td>Indicates whether to allow or deny traffic that matches the rule. Type: String Default: None Valid values: allow</td>
<td>Yes</td>
</tr>
<tr>
<td>Egress</td>
<td>Indicates whether this rule applies to egress traffic from the subnet (true) or ingress traffic to the subnet (false). Type: Boolean Default: false Valid values: true</td>
<td>No</td>
</tr>
<tr>
<td>CidrBlock</td>
<td>The CIDR range to allow or deny, in CIDR notation (for example, 172.16.0.0/24). Type: String Default: None</td>
<td>Yes</td>
</tr>
<tr>
<td>Icmp.Code</td>
<td>For the ICMP protocol, the ICMP code. You can use -1 to specify all ICMP codes for the given ICMP type. Type: Integer Default: None Condition: Required if specifying 1 (ICMP) for the protocol.</td>
<td>Conditional</td>
</tr>
</tbody>
</table>
### Response Elements

The elements in the following table are wrapped in a `ReplaceNetworkAclEntryResponse` element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request.</td>
</tr>
<tr>
<td></td>
<td>Type: <code>xsd:string</code></td>
</tr>
<tr>
<td>return</td>
<td>Returns <code>true</code> if the request succeeds. Otherwise, returns an error.</td>
</tr>
<tr>
<td></td>
<td>Type: <code>xsd:boolean</code></td>
</tr>
</tbody>
</table>

### Examples

#### Example Request

This example replaces the egress entry numbered 110 in the network ACL with ID acl-2cb85d45. The new rule denies egress traffic destined for anywhere (0.0.0.0/0) on TCP port 139.

```
https://ec2.amazonaws.com/?Action=ReplaceNetworkAclEntry
&NetworkAclId=acl-2cb85d45
&RuleNumber=110
&Protocol=tcp
&RuleAction=deny
&Egress=true
&CidrBlock=0.0.0.0/0
&PortRange.From=139
&PortRange.To=139
&AUTHPARAMS
```
Example Response

<ReplaceNetworkAclEntryResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/"
  requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <return>true</return>
</ReplaceNetworkAclEntryResponse>

ReplaceRoute

Description

Replaces an existing route within a route table in a VPC. For more information about route tables, see Route Tables in the Amazon Virtual Private Cloud User Guide.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>RouteTableId</td>
<td>The ID of the route table. Type: String Default: None</td>
<td>Yes</td>
</tr>
<tr>
<td>DestinationCidrBlock</td>
<td>The CIDR address block used for the destination match. For example: 0.0.0.0/0. The value you provide must match the CIDR of an existing route in the table. Type: String Default: None</td>
<td>Yes</td>
</tr>
<tr>
<td>GatewayId</td>
<td>The ID of a gateway attached to your VPC. Type: String Default: None Condition: You must provide only one of the following: a GatewayId, InstanceId, or NetworkInterfaceId.</td>
<td>Conditional</td>
</tr>
<tr>
<td>InstanceId</td>
<td>The ID of a NAT instance in your VPC. Type: String Default: None Condition: You must provide only one of the following: a GatewayId, InstanceId, or NetworkInterfaceId.</td>
<td>Conditional</td>
</tr>
<tr>
<td>NetworkInterfaceId</td>
<td>Allows routing to network interface attachments. Type: String Default: None Condition: You must provide only one of the following: GatewayId, InstanceId, or NetworkInterfaceId.</td>
<td>Conditional</td>
</tr>
</tbody>
</table>

Response Elements

The elements in the following table are wrapped in a ReplaceRouteResponse element.
### Examples

#### Example Request

This example replaces a route in the route table with ID rtb-e4ad488d. The new route matches the CIDR 10.0.0.0/8 and sends the traffic to the virtual private gateway with ID vgw-1d00376e.

```xml
https://ec2.amazonaws.com/?Action=ReplaceRoute
&RouteTableId=rtb-e4ad488d
&DestinationCidrBlock=10.0.0.0/8
&GatewayId=vgw-1d00376e
&AUTHPARAMS
```

#### Example Response

```xml
<ReplaceRouteResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <return>true</return>
</ReplaceRouteResponse>
```

ReplaceRouteTableAssociation

Description

Changes the route table associated with a given subnet in a VPC. After you execute this action, the subnet uses the routes in the new route table it's associated with. For more information about route tables, see Route Tables in the Amazon Virtual Private Cloud User Guide.

You can also use this action to change which table is the main route table in the VPC. You just specify the main route table's association ID and the route table that you want to be the new main route table.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>AssociationId</td>
<td>The ID representing the current association between the original route table and the subnet. Type: String Default: None</td>
<td>Yes</td>
</tr>
<tr>
<td>RouteTableId</td>
<td>The ID of the new route table to associate with the subnet. Type: String Default: None</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Response Elements

The elements in the following table are wrapped in a ReplaceRouteTableAssociationResponse element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request. Type: xsd:string</td>
</tr>
<tr>
<td>newAssociationId</td>
<td>The ID of the new association. Type: xsd:string</td>
</tr>
</tbody>
</table>

Examples

Example Request

This example starts with a route table associated with a subnet, and a corresponding association ID rtbassoc-f8ad4891. You want to associate a different route table (table rtb-f9ad4890) to the subnet. The result is a new association ID representing the new association.
Example Response

```xml
<ReplaceRouteTableAssociationResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <newAssociationId>rtbassoc-faad4893</newAssociationId>
</ReplaceRouteTableAssociationResponse>
```

ReportInstanceStatus

Description

Use this action to submit feedback about an instance’s status. This action works only for instances that are in the running state. If your experience with the instance differs from the instance status returned by the DescribeInstanceStatus action, use ReportInstanceStatus to report your experience with the instance. Amazon EC2 collects this information to improve the accuracy of status checks.

Note

Use of this action does not change the value returned by DescribeInstanceStatus.

To report an instance’s status, specify an instance ID with the InstanceID.n parameter and a reason code with the ReasonCodes.n parameter that applies to that instance. The following table contains descriptions of all available reason codes.

<table>
<thead>
<tr>
<th>Reason Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>instance-stuck-in-state</td>
<td>My instance is stuck in a state.</td>
</tr>
<tr>
<td>unresponsive</td>
<td>My instance is unresponsive.</td>
</tr>
<tr>
<td>not-accepting-credentials</td>
<td>My instance is not accepting my credentials.</td>
</tr>
<tr>
<td>password-not-available</td>
<td>A password is not available for my instance.</td>
</tr>
<tr>
<td>performance-network</td>
<td>My instance is experiencing performance problems which I believe are network related.</td>
</tr>
<tr>
<td>performance-instance-store</td>
<td>My instance is experiencing performance problems which I believe are related to the instance stores.</td>
</tr>
<tr>
<td>performance-ebs-volume</td>
<td>My instance is experiencing performance problems which I believe are related to an EBS volume.</td>
</tr>
<tr>
<td>performance-other</td>
<td>My instance is experiencing performance problems.</td>
</tr>
<tr>
<td>other</td>
<td>Other, explained in the submitted description parameter.</td>
</tr>
</tbody>
</table>

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>InstanceID.n</td>
<td>One or more instance IDs. Type: String</td>
<td>Yes</td>
</tr>
<tr>
<td>Status</td>
<td>The status of all instances listed in the InstanceID.n parameter. Type: String Valid values: ok</td>
<td>impaired</td>
</tr>
<tr>
<td>StartTime</td>
<td>The time at which the reported instance health state began. Type: DateTime</td>
<td>No</td>
</tr>
</tbody>
</table>
Response Elements

The elements in the following table are wrapped in a ReportInstanceStatusResponse element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request.</td>
<td></td>
</tr>
<tr>
<td>Return</td>
<td>Indicates whether the values submitted were accepted by Amazon EC2.</td>
<td></td>
</tr>
</tbody>
</table>

Examples

Example Request

This example reports instance health state for two instances.

https://ec2.amazonaws.com/?Action=ReportInstanceStatus&Status=impaired&InstanceId.0=i-9440effb&InstanceId.1=i-0cf27c63&Version=2012-10-01&AuthParams
Example Request

  <requestId>b8131cff-dfbd-4277-bafe-be006fd0c4da</requestId>
  <return>true</return>
</ReportInstanceStatusResponse>
RequestSpotInstances

Description

Creates a Spot Instance request. Spot Instances are instances that Amazon EC2 starts on your behalf when the maximum price that you specify exceeds the current Spot Price. Amazon EC2 periodically sets the Spot Price based on available Spot Instance capacity and current Spot Instance requests. For more information about Spot Instances, see Using Spot Instances in the Amazon Elastic Compute Cloud User Guide.

Note

Users must be subscribed to the required product to run an instance with AWS Marketplace product codes.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>SpotPrice</td>
<td>The maximum hourly price for any Spot Instance launched to fulfill the request. Type: String Default: None</td>
<td>Yes</td>
</tr>
<tr>
<td>InstanceCount</td>
<td>The maximum number of Spot Instances to launch. Type: Integer Default: 1</td>
<td>No</td>
</tr>
<tr>
<td>Type</td>
<td>The Spot Instance request type. Type: String Valid values: one-time</td>
<td>persistent Default: one-time</td>
</tr>
<tr>
<td>ValidFrom</td>
<td>The start date of the request. If this is a one-time request, the request becomes active at this date and time and remains active until all instances launch, the request expires, or the request is canceled. If the request is persistent, the request becomes active at this date and time and remains active until it expires or is canceled. Type: DateTime Default: Request is effective independently</td>
<td>No</td>
</tr>
<tr>
<td>ValidUntil</td>
<td>The end date of the request. If this is a one-time request, the request remains active until all instances launch, the request is canceled, or this date is reached. If the request is persistent, it remains active until it is canceled or this date and time is reached. Type: DateTime Default: Request is effective indefinitely</td>
<td>No</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Required</td>
</tr>
<tr>
<td>------</td>
<td>-------------</td>
<td>----------</td>
</tr>
<tr>
<td><strong>LaunchGroup</strong></td>
<td>The instance launch group. Launch groups are Spot Instances that launch together and terminate together. Type: String Default: Instances are launched and terminated individually</td>
<td>No</td>
</tr>
<tr>
<td><strong>AvailabilityZoneGroup</strong></td>
<td>The user-specified name for a logical grouping of bids. When you specify <code>AvailabilityZoneGroup</code> in a Spot Instance request, all Spot Instances in the request are launched in the same Availability Zone. Instance proximity is maintained with this parameter, but choice of Availability Zone is not. <code>AvailabilityZoneGroup</code> applies only to bids for Spot Instances of the same instance type. Any additional Spot Instance requests that are specified with the same <code>AvailabilityZoneGroup</code> name will be launched in that same Availability Zone, as long as at least one instance from the group is still active. If there is no active instance running in the Availability Zone group that you specify for a new Spot Instance request (i.e., all instances are terminated, the bid is expired, or the bid falls below current market), then Amazon EC2 will launch the instance in any Availability Zone where the constraint can be met. Consequently, the subsequent set of Spot Instances could be placed in a different zone from the original request, even if the same <code>AvailabilityZoneGroup</code> name was specified. To ensure that all Spot Instances across all bids are launched into a particular Availability Zone, specify <code>LaunchSpecification.Placement.AvailabilityZone</code> in the API or <code>--availability-zone</code> in the CLI. Type: String Default: Instances are launched in any available Availability Zone.</td>
<td>No</td>
</tr>
<tr>
<td><strong>LaunchSpecification.ImageId</strong></td>
<td>The ID of the AMI. Type: String Default: None</td>
<td>Yes</td>
</tr>
<tr>
<td><strong>LaunchSpecification.KeyName</strong></td>
<td>The name of the key pair. Type: String Default: None</td>
<td>No</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Required</td>
</tr>
<tr>
<td>------</td>
<td>-------------</td>
<td>----------</td>
</tr>
<tr>
<td>LaunchSpecification.SecurityGroupId.n</td>
<td>The ID of the security group. You can use either this parameter or the next to specify a security group. You can use this parameter when launching instances with or without Amazon VPC. Type: String Default: The instance uses the default security group Condition: If you want to specify one or more security groups, you can use either LaunchSpecification.SecurityGroupId.n or LaunchSpecification.SecurityGroup.n.</td>
<td>Conditional</td>
</tr>
<tr>
<td>LaunchSpecification.SecurityGroup.n</td>
<td>The name of the security group. You cannot use this parameter when launching an instance with Amazon VPC. Type: String Default: The instance uses the default security group Condition: If you want to specify one or more security groups, you can use either LaunchSpecification.SecurityGroupId.n or LaunchSpecification.SecurityGroup.n.</td>
<td>Conditional</td>
</tr>
<tr>
<td>LaunchSpecification.UserData</td>
<td>The MIME, Base64-encoded user data to make available to the instances. Type: String Default: None</td>
<td>No</td>
</tr>
<tr>
<td>LaunchSpecification.AddressingType</td>
<td>Deprecated. Type: String Default: None</td>
<td>No</td>
</tr>
<tr>
<td>LaunchSpecification.InstanceType</td>
<td>The instance type. Type: String Valid values: m1.small</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>m1.large</td>
<td>m1.xlarge</td>
</tr>
<tr>
<td></td>
<td>c1.medium</td>
<td>c1.xlarge</td>
</tr>
<tr>
<td></td>
<td>Default: m1.small</td>
<td></td>
</tr>
<tr>
<td>LaunchSpecification.Placement.AvailabilityZone</td>
<td>The placement constraint (i.e., specific Availability Zone) for launching the instances. Specify if you want all of the Spot Instances in all of your bids to be launched in a particular Availability Zone. Specifying this option requires Amazon EC2 to find capacity in the specified Availability Zone instead of letting Amazon EC2 pick the best Availability Zone available; this can potentially delay the fulfillment of your bid, and/or require a higher bid price. Type: String Default: Amazon EC2 selects an Availability Zone.</td>
<td>No</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Required</td>
</tr>
<tr>
<td>------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>----------</td>
</tr>
</tbody>
</table>
| `LaunchSpecification.Placement.GroupName` | The name of an existing placement group you want to launch the instance into (for cluster instances). Type: String  
Default: None.                                                                                         | No       |
| `LaunchSpecification.KernelId`           | The ID of the kernel. Type: String  
Default: None                                                                                             | No       |
| `LaunchSpecification.RamdiskId`          | The ID of the RAM disk. Some kernels require additional drivers at launch. Check the kernel requirements for information on whether you need to specify a RAM disk and search for the kernel ID.  
Type: String  
Default: None                                                                                     | No       |
| `LaunchSpecification.BlockDeviceMapping.n.DeviceName` | The device named exposed to the instance (for example, /dev/sdh or xvdh). For more information, see Block Device Mapping.  
Type: String  
Default: None                                                                                     | No       |
Type: Boolean  
Default: true                                                                                       | No       |
| `LaunchSpecification.BlockDeviceMapping.n.VirtualName` | The name of the virtual device, ephemeral[0..3]. The number of instance store volumes depends on the instance type.  
Type: String  
Default: None                                                                                     | No       |
Type: String  
Default: None                                                                                     | No       |
Type: Integer  
Valid values: If the volume type is io1, the minimum size of the volume is 10 GiB.  
Default: If you’re creating the volume from a snapshot and don’t specify a volume size, the default is the snapshot size.  
Condition: Required unless you’re creating the volume from a snapshot.                                                   | Conditional |
| `LaunchSpecification.BlockDeviceMapping.n.Ebs.DeleteOnTermination` | Whether the volume is deleted on instance termination.  
Type: Boolean  
Default: true                                                                                      | No       |
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>LaunchSpecification.BlockDeviceMapping.n.Ebs.VolumeType</code></td>
<td>The volume type. Type: String Valid values: <code>standard</code></td>

API Version 2012-10-01

Specifies the number of secondary private IP addresses to assign to a network interface. When you specify a number of secondary IP addresses, AWS automatically assigns these IP addresses within the subnet’s range (available only in Amazon VPC).

The number of IP addresses you can assign to a network interface varies by instance type. For more information, go to Available Instance Types in the Amazon Elastic Compute Cloud User Guide.

For a single network interface, you cannot specify this option and specify more than one private IP address using LaunchSpecification.NetworkInterface.PrivateIpAddress.

Type: Integer
Default: None

LaunchSpecification.NetworkInterface.n.SecurityGroupId.n

The security group IDs to associate with the created instance. Applies only when creating new network interfaces.

Type: String
Default:

LaunchSpecification.NetworkInterface.n.DeleteOnTermination

Applies to all network interfaces.

Type: Boolean
Default:

LaunchSpecification.IamInstanceProfile.Arn

The Amazon resource name (ARN) of the IAM Instance Profile (IIP) to associate with the instances.

Type: String
Default: None

LaunchSpecification.IamInstanceProfile.Name

The name of the IAM Instance Profile (IIP) to associate with the instances.

Type: String
Default: None

LaunchSpecification.EbsOptimized

Whether the instance is optimized for EBS I/O. This optimization provides dedicated throughput to Amazon EBS and an optimized configuration stack to provide optimal EBS I/O performance. This optimization isn’t available with all instance types. Additional usage charges apply when using an EBS Optimized instance.

Type: Boolean
Default: false

Response Elements

The elements in the following table are wrapped in a RequestSpotInstancesResponse element.
### Examples

#### Example Request

This example creates a Spot Instances request for two `m1.small` instances and associates an IAM instance profile called "s3access" with them.

```xml
https://ec2.amazonaws.com/?Action=RequestSpotInstances
&SpotPrice=0.50
&InstanceCount=2
&Type=one-time
&AvailabilityZoneGroup=MyAzGroup
&LaunchSpecification.ImageId=ami-43a4412a
&LaunchSpecification.KeyName=MyKeypair
&LaunchSpecification.Group.1=websrv
&LaunchSpecification.InstanceType=m1.small
&LaunchSpecification.IamInstanceProfile.Name=s3access
&AUTHPARAMS
```

#### Example Response

```xml
<RequestSpotInstancesResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <spotInstanceRequestSet>
    <item>
      <spotInstanceRequestId>sir-83d64e02</spotInstanceRequestId>
      <spotPrice>0.5</spotPrice>
      <type>one-time</type>
      <state>open</state>
      <availabilityZoneGroup>MyAzGroup</availabilityZoneGroup>
      <launchSpecification>
        <imageId>ami-43a4412a</imageId>
        <groupSet>
          <item>
            <groupId></groupId>
            <groupName></groupName>
          </item>
        </groupSet>
        <instanceType>m1.small</instanceType>
        <blockDeviceMapping/>
        <monitoring>
          <enabled>false</enabled>
        </monitoring>
      </launchSpecification>
    </item>
  </spotInstanceRequestSet>
</RequestSpotInstancesResponse>
```

ResetImageAttribute

Description

Resets an attribute of an AMI to its default value.

Note

The productCodes attribute cannot be reset.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>ImageId</td>
<td>The ID of the AMI. Type: String Default: None</td>
<td>Yes</td>
</tr>
<tr>
<td>Attribute</td>
<td>The attribute to reset (currently you can only reset the launch permission attribute). Type: String Default: None Valid value: launchPermission</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Response Elements

The elements in the following table are wrapped in a ResetImageAttributeResponse element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request. Type: xsd:string</td>
</tr>
<tr>
<td>return</td>
<td>Returns true if the request succeeds. Otherwise, returns an error. Type: xsd:boolean</td>
</tr>
</tbody>
</table>

Examples

Example Request

This example resets the launchPermission attribute for the specified AMI.

https://ec2.amazonaws.com/?Action=ResetImageAttribute
&ImageId=ami-61a54008
&Attribute=launchPermission
&AUTHPARAMS
Example Response

<ResetImageAttributeResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/"
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <return>true</return>
</ResetImageAttributeResponse>

Related Operations

• ModifyImageAttribute (p. 357)
• DescribeImageAttribute (p. 183)
ResetInstanceAttribute

Description

Resets an attribute of an instance to its default value. To reset the kernel or RAM disk, the instance must be in a stopped state. To reset the `SourceDestCheck`, the instance can be either running or stopped.

The `SourceDestCheck` attribute exists to enable a Network Address Translation (NAT) instance in a VPC to perform NAT. The attribute controls whether source/destination checking is enabled on the instance. The default value is `true`, which means checking is enabled. The value must be `false` for the instance to perform NAT. For more information, see NAT Instances in the Amazon Virtual Private Cloud User Guide.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>InstanceId</td>
<td>The ID of the instance. Type: String</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td>Attribute</td>
<td>The attribute to reset. Type: String</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Valid values: <code>kernel</code></td>
<td><code>ramdisk</code></td>
</tr>
</tbody>
</table>

Response Elements

The elements in the following table are wrapped in a `ResetInstanceAttributeResponse` element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request. Type: xsd:string</td>
</tr>
<tr>
<td>return</td>
<td>Returns <code>true</code> if the request succeeds. Otherwise, returns an error. Type: xsd:boolean</td>
</tr>
</tbody>
</table>

Examples

Example Request

This example resets the `kernel` attribute.

```
https://ec2.amazonaws.com/?Action=ResetInstanceAttribute
&InstanceId=i-10a64379
&Attribute=kernel
&AUTHPARAMS
```
Example Response

```
<ResetInstanceAttributeResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <return>true</return>
</ResetInstanceAttributeResponse>
```

ResetNetworkInterfaceAttribute

**Description**

Resets a network interface attribute. You can specify only one attribute at a time.

**Request Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>NetworkInterfaceId</td>
<td>The ID of the network interface. Type: String</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
<tr>
<td>Attribute=sourceDestCheck</td>
<td>The name of the attribute to reset; sourceDestCheck defaults to true. Type: String</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Default: None</td>
<td></td>
</tr>
</tbody>
</table>

**Response Elements**

The elements in the following table are wrapped in a `ResetNetworkInterfaceAttributeResponse` element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>

ResetSnapshotAttribute

Description
Resets permission settings for the specified snapshot.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>SnapshotId</td>
<td>The ID of the snapshot. Type: String Default: None</td>
<td>Yes</td>
</tr>
<tr>
<td>Attribute</td>
<td>The attribute to reset (currently only the attribute for permission to create volumes can be reset) Type: String Default: None Valid value: createVolumePermission</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Response Elements
The elements in the following table are wrapped in a ResetSnapshotAttributeResponse element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request. Type: xsd:string</td>
</tr>
<tr>
<td>return</td>
<td>Returns true if the request succeeds. Otherwise, returns an error. Type: xsd:boolean</td>
</tr>
</tbody>
</table>

Examples

Example Request
This example resets the permissions for snap-78a54011, making it a private snapshot that can only be used by the account that created it.

https://ec2.amazonaws.com/?Action=ResetSnapshotAttribute
&SnapshotId=snap-78a54011
&Attribute=createVolumePermission
&AUTHPARAMS
Example Response

```xml
<ResetSnapshotAttributeResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/"
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <return>true</return>
</ResetSnapshotAttributeResponse>

RevokeSecurityGroupEgress

Description

This action applies only to security groups in a VPC. It doesn’t work with EC2 security groups. For information about Amazon Virtual Private Cloud and VPC security groups, see Security Groups in the Amazon Virtual Private Cloud User Guide.

The action removes one or more egress rules from a VPC security group. The values that you specify in the revoke request (e.g., ports, etc.) must match the existing rule’s values for the rule to be revoked.

Each rule consists of the protocol and the CIDR range or destination security group. For the TCP and UDP protocols, you must also specify the destination port or range of ports. For the ICMP protocol, you must also specify the ICMP type and code.

Rule changes are propagated to instances within the security group as quickly as possible. However, a small delay might occur.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>GroupId</td>
<td>The ID of the VPC security group to modify. Type: String Default: None</td>
<td>Yes</td>
</tr>
<tr>
<td>IpPermissions.n.IpProtocol</td>
<td>The IP protocol name or number (go to Protocol Numbers). When you call DescribeSecurityGroups, the protocol value returned is the number. Exception: For TCP, UDP, and ICMP, the value returned is the name (for example, tcp, udp, or icmp). Type: String Valid values: tcp</td>
<td>udp</td>
</tr>
<tr>
<td>IpPermissions.n.FromPort</td>
<td>The start of port range for the TCP and UDP protocols, or an ICMP type number. For the ICMP type number, you can use -1 to specify all ICMP types. Type: Integer Default: None Condition: Required for ICMP and any protocol that uses ports</td>
<td>Conditional</td>
</tr>
<tr>
<td>IpPermissions.n.ToPort</td>
<td>The end of port range for the TCP and UDP protocols, or an ICMP code number. For the ICMP code number, you can use -1 to specify all ICMP codes for the given ICMP type. Type: Integer Default: None Condition: Required for ICMP and any protocol that uses ports</td>
<td>Conditional</td>
</tr>
</tbody>
</table>
**Response Elements**

The elements in the following table are wrapped in a RevokeSecurityGroupEgressResponse element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>The ID of the request. Type: xsd:string</td>
</tr>
<tr>
<td>return</td>
<td>Returns true if the request succeeds. Otherwise, returns an error. Type: xsd:boolean</td>
</tr>
</tbody>
</table>

**Examples**

**Example Request**

This example revokes the access that the websrv VPC security group (with ID sg-1a2b3c4d) has to the 205.192.0.0/16 and 205.159.0.0/16 address ranges on TCP port 80.

```xml
&GroupName=websrv
&GroupName=sg-1a2b3c4d
&IpPermissions.1.IpProtocol=tcp
&IpPermissions.1.FromPort=80
&IpPermissions.1.ToPort=80
&IpPermissions.1.IpRanges.1.CidrIp=205.192.0.0/16
&IpPermissions.1.IpRanges.2.CidrIp=205.159.0.0/16
&AUTHPARAMS
```

**Example Request**

This example revokes the access that the VPC security group with ID sg-1a2b3c4d has to the VPC security group with ID sg-9a8d7f5c on TCP port 1433.

```
&GroupName=websrv
&GroupName=sg-1a2b3c4d
&IpPermissions.1.IpProtocol=tcp
&IpPermissions.1.FromPort=1433
&IpPermissions.1.ToPort=1433
&IpPermissions.1.IpRanges.1.CidrIp=205.192.0.0/16
&IpPermissions.1.IpRanges.2.CidrIp=205.159.0.0/16
&AUTHPARAMS
```
&GroupId=sg-1a2b3c4d
&IpPermissions.1.IpProtocol=tcp
&IpPermissions.1.FromPort=1433
&IpPermissions.1.ToPort=1433
&IpPermissions.1.Groups.1.GroupId=sg-9a8d7f5c
&AUTHPARAMS

Example Response

<RevokeSecurityGroupEgressResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <return>true</return>

RevokeSecurityGroupIngress

Description

This action applies to both EC2 security groups and VPC security groups. For information about VPC security groups and how they differ from EC2 security groups, see Security Groups in the Amazon Virtual Private Cloud User Guide.

This action removes one or more ingress rules from a security group. The values that you specify in the revoke request (e.g., ports, etc.) must match the existing rule’s values for the rule to be removed.

Each rule consists of the protocol and the CIDR range or source security group. For the TCP and UDP protocols, you must also specify the destination port or range of ports. For the ICMP protocol, you must also specify the ICMP type and code.

Rule changes are propagated to instances within the security group as quickly as possible. However, depending on the number of instances, a small delay might occur.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>

## Examples

### Example Request

This example revokes TCP port 80 access from the 205.192.0.0/16 address range for the websrv security group. Note that if the security group were a VPC security group, the ID of the security group would instead be required in the request.

```
https://ec2.amazonaws.com/?Action=RevokeSecurityGroupIngress
&GroupName=websrv
&IpProtocol=tcp
&FromPort=80
&ToPort=80
&CidrIp=205.192.0.0/16
&AUTHPARAMS
```

### Example Response

```
<RevokeSecurityGroupIngressResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <return>true</return>
</RevokeSecurityGroupIngressResponse>
```

RunInstances

Description

Launches the specified number of instances of an AMI for which you have permissions.

If Amazon EC2 cannot launch the minimum number of instances you request, no instances will be launched. If there is insufficient capacity to launch the maximum number of instances you request, Amazon EC2 launches the minimum number specified and allocates the remaining available instances using round robin.

Note
Every instance is launched in a security group (created using the CreateSecurityGroup operation). If you don't specify a security group in the RunInstances request, the "default" security group is used.

For Linux instances, you can provide an optional key pair ID in the launch request (created using the CreateKeyPair or ImportKeyPair operation). The instances will have access to the public key at boot. You can use this key to provide secure access to an instance of an image on a per-instance basis. Amazon EC2 public images use this feature to provide secure access without passwords.

Important
Launching public images without a key pair ID will leave them inaccessible.

The public key material is made available to the instance at boot time by placing it in the openssh_id.pub file on a logical device that is exposed to the instance as /dev/sda2 (the instance store). The format of this file is suitable for use as an entry within ~/.ssh/authorized_keys (the OpenSSH format). This can be done at boot (e.g., as part of rc.local) allowing for secure access without passwords.

You can provide optional user data in the launch request. All instances that collectively comprise the launch request have access to this data. For more information, see Instance Metadata in the Amazon Elastic Compute Cloud User Guide.

Note
If any of the AMIs have a product code attached for which the user has not subscribed, the RunInstances call will fail.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>ImageId</td>
<td>The ID of the AMI. Type: String Default: None</td>
<td>Yes</td>
</tr>
<tr>
<td>MinCount</td>
<td>The minimum number of instances to launch. If the value is more than Amazon EC2 can launch, no instances are launched at all. Type: Integer Default: None Constraints: Between 1 and the maximum number allowed for your account (the default for each account is 20, but this limit can be increased).</td>
<td>Yes</td>
</tr>
</tbody>
</table>
### Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>MaxCount</strong></td>
<td>The maximum number of instances to launch. If the value is more than Amazon EC2 can launch, the largest possible number above MinCount will be launched instead. Type: Integer Default: None Constraints: Between 1 and the maximum number allowed for your account (the default for each account is 20, but this limit can be increased).</td>
<td>Yes</td>
</tr>
<tr>
<td><strong>KeyName</strong></td>
<td>The name of the key pair to use. Type: String Default: None</td>

<td>The ID of the kernel with which to launch the instance. Type: String Default: None</td>
<td>No</td>
</tr>
<tr>
<td>RamdiskId</td>
<td>The ID of the RAM disk. Some kernels require additional drivers at launch. Check the kernel requirements for information on whether you need to specify a RAM disk. To find kernel requirements, refer to the Resource Center and search for the kernel ID. Type: String Default: None</td>
<td>No</td>
</tr>
<tr>
<td>BlockDeviceMapping.n.DeviceName</td>
<td>The device name exposed to the instance (for example, /dev/sdh or xvdh). For more information, see Block Device Mapping. Type: String Default: None</td>
<td>No</td>
</tr>
<tr>
<td>BlockDeviceMapping.n.NoDevice</td>
<td>Suppresses the device mapping. Type: empty element Default: None</td>
<td>No</td>
</tr>
<tr>
<td>BlockDeviceMapping.n.VirtualName</td>
<td>The virtual device name, ephemeral[0..3]. The number of instance store volumes depends on the instance type. Type: String Default: None</td>
<td>No</td>
</tr>
<tr>
<td>BlockDeviceMapping.n.Ebs.SnapshotId</td>
<td>The ID of the snapshot. Type: String Default: None</td>
<td>No</td>
</tr>
<tr>
<td>BlockDeviceMapping.n.Ebs.VolumeSize</td>
<td>The size of the volume, in GiBs. Type: Integer Valid values: If the volume type is io1, the minimum size of the volume is 10 GiB. Default: If you’re creating the volume from a snapshot and don’t specify a volume size, the default is the snapshot size. Condition: Required unless you’re creating the volume from a snapshot.</td>
<td>Conditional</td>
</tr>
<tr>
<td>BlockDeviceMapping.n.Ebs.DeleteOnTermination</td>
<td>Whether the volume is deleted on instance termination. Type: Boolean Default: true</td>
<td>No</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
<td>Required</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>----------</td>
</tr>
</tbody>
</table>
| BlockDeviceMapping.n.Ebs.VolumeType | The volume type.  
  Type: String  
  Valid values: `standard | `io1  
  Default: `standard                                                                                     | No       |
| BlockDeviceMapping.n.Ebs.Iops | The number of I/O operations per second (IOPS) that the volume supports.  
  Type: Integer  
  Valid values: Range is 100 to 2000.  
  Default: None  
  Condition: Required when the volume type is `io1`; not used with `standard` volumes. | Conditional |
| Monitoring.Enabled            | Enables monitoring for the instance.  
  Type: Boolean  
  Default: false                                                                                       | No       |
| SubnetId                      | If you're using Amazon Virtual Private Cloud, this specifies the ID of the subnet you want to launch the instance into.  
  Type: String  
  Default: None                                                                                       | No       |
| DisableApiTermination         | Whether you can terminate the instance using the EC2 API. A value of `true` means you can't terminate the instance using the API (i.e., the instance is "locked"); a value of `false` means you can. If you set this to `true`, and you later want to terminate the instance, you must first change the `disableApiTermination` attribute's value to `false` using `ModifyInstanceAttribute`.  
  Type: Boolean  
  Default: false                                                                                     | No       |
| InstanceInitiatedShutdownBehavior | Whether the instance stops or terminates on instance-initiated shutdown.  
  Type: String  
  Valid values: `stop | `terminate  
  Default: `stop                                                                                     | No       |
| PrivateIpAddress             | If you're using Amazon Virtual Private Cloud, you can optionally use this parameter to assign the instance a specific available IP address from the subnet (e.g., 10.0.0.25) as the primary IP address.  
  Only one private IP address can be designated as primary. Therefore, you cannot specify this parameter if you are also specifying `PrivateIpAddresses.n.Primary` with a value of `true` with the `PrivateIpAddresses.n.PrivateIpAddress` option.  
  Type: String  
  Default: Amazon VPC selects an IP address from the subnet for the instance                             | No       |
<table>

StartInstances

Description

Starts an Amazon EBS-backed AMI that you've previously stopped.

Instances that use Amazon EBS volumes as their root devices can be quickly stopped and started. When an instance is stopped, the compute resources are released and you are not billed for hourly instance usage. However, your root partition Amazon EBS volume remains, continues to persist your data, and you are charged for Amazon EBS volume usage. You can restart your instance at any time. Each time you transition an instance from stopped to started, we charge a full instance hour, even if transitions happen multiple times within a single hour.

Note
Before stopping an instance, make sure it is in a state from which it can be restarted. Stopping an instance does not preserve data stored in RAM. Performing this operation on an instance that uses an instance store as its root device returns an error.

For more information, see Using Amazon EBS-Backed AMIs and Instances.

- TerminateInstances (p. 432)
StopInstances

Description

Stops an Amazon EBS-backed instance. Each time you transition an instance from stopped to started, we charge a full instance hour, even if transitions happen multiple times within a single hour.

Important

Although Spot Instances can use Amazon EBS-backed AMIs, they don't support Stop/Start. In other words, you can't stop and start Spot Instances launched from an AMI with an Amazon EBS root device.

Instances that use Amazon EBS volumes as their root devices can be quickly stopped and started. When an instance is stopped, the compute resources are released and you are not billed for hourly instance usage. However, your root partition Amazon EBS volume remains, continues to persist your data, and you are charged for Amazon EBS volume usage. You can restart your instance at any time.

Note

Before stopping an instance, make sure it is in a state from which it can be restarted. Stopping an instance does not preserve data stored in RAM. Performing this operation on an instance that uses an instance store as its root device returns an error.

You can stop, start, and terminate EBS-backed instances. You can only terminate S3-backed instances. What happens to an instance differs if you stop it or terminate it. For example, when you stop an instance, the root device and any other devices attached to the instance persist. When you terminate an instance, the root device and any other devices attached during the instance launch are automatically deleted. For more information about the differences between stopping and terminating instances, go to the "Stop/Start" and "Instance Termination" in Basics of Amazon EBS-Backed AMIs and Instances in the Amazon EC2 User Guide.

Request Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>InstanceId.n</td>
<td>One or more instance IDs. Type: String</td>
<td>Yes</td>
</tr>
<tr>
<td>Force</td>
<td>Forces the instance to stop. The instance will not have an opportunity to flush file system caches or file system metadata. If you use this option, you must perform file system check and repair procedures. This option is not recommended for Windows instances.</td>
<td>No</td>
</tr>
</tbody>
</table>

Response Elements

The elements in the following table are wrapped in a StopInstancesResponse element.
### Examples

#### Example Request

This example stops the i-10a64379 instance without using the "force" option.

```
https://ec2.amazonaws.com/?Action=StopInstances
&InstanceId.1=i-10a64379
&AUTHPARAMS
```

#### Example Response

```
<StopInstancesResponse xmlns="http://ec2.amazonaws.com/doc/2012-10-01/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <instancesSet>
    <item>
      <instanceId>i-10a64379</instanceId>
      <currentState>
        <code>64</code>
        <name>stopping</name>
      </currentState>
      <previousState>
        <code>16</code>
        <name>running</name>
      </previousState>
    </item>
  </instancesSet>
</StopInstancesResponse>
```

- StartInstances (p. 428)
- RunInstances (p. 417)
- DescribeInstances (p. 197)
- TerminateInstances (p. 432)
Terminatelnstances

Description

Shuts down one or more instances. This operation is idempotent; if you terminate an instance more than once, each call will succeed.

Terminated instances will remain visible after termination (approximately one hour).

Note
By default, Amazon EC2 deletes all Amazon EBS volumes that were attached when the instance launched. Amazon EBS volumes attached after instance launch continue running.

You can stop, start, and terminate EBS-backed instances. You can only terminate S3-backed instances. What happens to an instance differs if you stop it or terminate it. For example, when you stop an instance, the root device and any other devices attached to the instance persist. When you terminate an instance, the root device and any other devices attached during the instance launch are automatically deleted. For more information about the differences between stopping and terminating instances, go to the "Stop/Start" and "Instance Termination" in Basics of Amazon EBS-Backed AMIs and Instances in the Amazon EC2 User Guide.

AssignPrivateIpAddressesSetItemRequestType

Describes a private IP address.

Ancestors

• AssignPrivateIpAddressesType

Relevant Operations

• AssignPrivateIpAddresses (p. 15)
• UnassignPrivateIpAddresses (p. 434)

Contents

The following table describes the elements in this data type.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>privateIpAddress</td>
<td>The private IP address. Type: String</td>
</tr>
</tbody>
</table>

AttachmentSetItemResponseType

The AttachmentSetItemResponseType data type.

Ancestors

• AttachmentSetResponseType

Relevant Operations

• DescribeVolumes

Contents

The following table describes the elements in this data type.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>volumeId</td>
<td>The ID of the volume. Type: String</td>
</tr>
<tr>
<td>instanceId</td>
<td>The ID of the instance. Type: String</td>
</tr>
</tbody>
</table>
### AttachmentType

Describes an attachment between a virtual private gateway and a VPC.

#### Ancestors

- AttachmentSetType

#### Relevant Operations

- AttachVpnGateway (p. 31)
- CreateVpnGateway (p. 117)
- DescribeVpnGateways (p. 322)

#### Contents

The following table describes the elements in this data type.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>device</td>
<td>The device name exposed to the instance (e.g., /dev/sdh). Type: String</td>
</tr>
<tr>
<td>status</td>
<td>The attachment state. Type: String Valid values: attaching</td>
</tr>
<tr>
<td>attachTime</td>
<td>The time stamp when the attachment initiated. Type: DateTime</td>
</tr>
<tr>
<td>deleteOnTermination</td>
<td>Whether the Amazon EBS volume is deleted on instance termination. Type: Boolean</td>
</tr>
</tbody>
</table>

### AvailabilityZoneltemType

The AvailabilityZoneltemType data type.
Ancestors

- AvailabilityZoneSetType

Relevant Operations

- DescribeAvailabilityZones

Contents

The following table describes the elements in this data type.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>zoneName</td>
<td>The name of the Availability Zone. Type: String</td>
</tr>
<tr>
<td>zoneState</td>
<td>The state of the Availability Zone. Type: String</td>
</tr>
<tr>
<td>regionName</td>
<td>The name of the Region. Type: String</td>
</tr>
<tr>
<td>messageSet</td>
<td>Any messages about the Availability Zone, each one wrapped in an item element. Type: AvailabilityZoneMessageType (p. 443)</td>
</tr>
</tbody>
</table>

AvailabilityZoneMessageType

The AvailabilityZoneMessageType data type.

Ancestors

- AvailabilityZoneMessageSetType

Relevant Operations

- DescribeAvailabilityZones

Contents

The following table describes the elements in this data type.
BlockDeviceMappingItemType

Describes a block device mapping.

Ancestors

• BlockDeviceMappingType

Relevant Operations

• DescribeImageAttribute (p. 183)
• DescribeImages (p. 186)
• DescribeSpotInstanceRequests (p. 283)
• RegisterImage (p. 376)
• RequestSpotInstances (p. 394)
• RunInstances (p. 417)

Contents

The following table describes the elements in this data type.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>message</td>
<td>The message about the Availability Zone. Type: String</td>
</tr>
<tr>
<td>deviceName</td>
<td>The device name exposed to the instance (e.g., /dev/sdh). Type: String</td>
</tr>
<tr>
<td>virtualName</td>
<td>The virtual device name. Type: String</td>
</tr>
<tr>
<td>ebs</td>
<td>Parameters used to automatically set up Amazon EBS volumes when the instance is launched. Type: EbsBlockDeviceType (p. 465)</td>
</tr>
<tr>
<td>noDevice</td>
<td>Include this empty element to suppress the specified device included in the block device mapping of the AMI.</td>
</tr>
</tbody>
</table>

BundleInstanceS3StorageType

The BundleInstanceS3StorageType data type.
Ancestors

- BundleInstanceTaskStorageType (p. 446)

Relevant Operations

- BundleInstance
- DescribeBundleTasks
- CancelBundleTask
- BundleInstance

Contents

The following table describes the elements in this data type.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>awsAccessKeyId</td>
<td>The Access Key ID of the owner of the Amazon S3 bucket. Type: String</td>
</tr>
<tr>
<td>bucket</td>
<td>The bucket in which to store the AMI. You can specify a bucket that you already own or a new bucket that Amazon EC2 creates on your behalf. If you specify a bucket that belongs to someone else, Amazon EC2 returns an error. Type: String</td>
</tr>
<tr>
<td>prefix</td>
<td>The beginning of the file name of the AMI. Type: String</td>
</tr>
<tr>
<td>uploadPolicy</td>
<td>A Base64-encoded Amazon S3 upload policy that gives Amazon EC2 permission to upload items into Amazon S3 on the user's behalf. Type: String</td>
</tr>
<tr>
<td>uploadPolicySignature</td>
<td>The signature of the Base64 encoded JSON document. Type: String</td>
</tr>
</tbody>
</table>

BundleInstanceTaskErrorType

The BundleInstanceTaskErrorType data type.

Ancestors

- BundleInstanceTaskType (p. 447)
**Relevant Operations**

- BundleInstance
- DescribeBundleTasks
- CancelBundleTask

**Contents**

The following table describes the elements in this data type.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>code</td>
<td>The error code.</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
</tr>
<tr>
<td>message</td>
<td>The error message.</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
</tr>
</tbody>
</table>

**BundleInstanceTaskStorageType**

The BundleInstanceTaskStorageType data type.

**Ancestors**

- BundleInstanceTaskType (p. 447)

**Relevant Operations**

- BundleInstance
- DescribeBundleTasks
- CancelBundleTask
- BundleInstance

**Contents**

The following table describes the elements in this data type.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>S3</td>
<td>An Amazon S3 storage location.</td>
</tr>
<tr>
<td></td>
<td>Type: BundleInstanceS3StorageType (p. 444)</td>
</tr>
</tbody>
</table>
BundleInstanceTaskType

Describes a bundle task.

Ancestors

- BundleInstanceTasksSetType

Relevant Operations

- BundleInstance (p. 40)
- CancelBundleTask (p. 43)
- DescribeBundleTasks (p. 169)

Contents

The following table describes the elements in this data type.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>instanceId</td>
<td>The ID of the instance associated with this bundle task. Type: String</td>
</tr>
<tr>
<td>bundleId</td>
<td>The ID for this bundle task. Type: String</td>
</tr>
<tr>
<td>state</td>
<td>The state of the task. Type: String</td>
</tr>
<tr>
<td></td>
<td>Valid values: pending</td>
</tr>
<tr>
<td>startTime</td>
<td>The time this task started. Type: DateTime</td>
</tr>
<tr>
<td>updateTime</td>
<td>The time of the most recent update for the task. Type: DateTime</td>
</tr>
<tr>
<td>storage</td>
<td>The Amazon S3 storage locations. Type: BundleInstanceTaskStorageType (p. 446)</td>
</tr>
<tr>
<td>progress</td>
<td>The level of task completion, as a percent (for example, 20%). Type: String</td>
</tr>
<tr>
<td>error</td>
<td>If the task fails, a description of the error. Type: BundleInstanceTaskErrorType (p. 445)</td>
</tr>
</tbody>
</table>
CancelSpotInstanceRequestsResponseSetItemType

The CancelSpotInstanceRequestsResponseSetItemType data type.

Ancestors

• CancelSpotInstanceRequestsResponseSetType

Relevant Operations

• CancelSpotInstanceRequests

Contents

The following table describes the elements in this data type.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>spotInstanceRequestId</td>
<td>The ID of the Spot Instance request. Type: String</td>
</tr>
<tr>
<td>state</td>
<td>The state of the Spot Instance request. Type: String</td>
</tr>
<tr>
<td></td>
<td>Valid values: active</td>
</tr>
</tbody>
</table>

ConversionTaskType

The ConversionTaskType data type.

Ancestors

• ConversionTaskSetType

Relevant Operations

• DescribeConversionTasks
  • ImportInstance
  • ImportVolume

Contents

The following table describes the elements in this data type.
CreateVolumePermissionItemType

The CreateVolumePermissionItemType data type.

Ancestors

- CreateVolumePermissionListType

Relevant Operations

- ModifySnapshotAttribute
- DescribeSnapshotAttribute

Contents

The following table describes the elements in this data type.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| conversionTaskId | The ID of the conversion task  
Type: String                                               |
| expirationTime | The time when the task expires. If the upload isn’t complete before  
the expiration time, we automatically cancel the task.  
Type: String                                                   |
| importVolume  | If the task is for importing a volume, this contains information about  
the import volume task.  
Type: ImportVolumeTaskDetailsType (p. 473)                          |
| importInstance | If the task is for importing an instance, this contains information about  
the import instance task.  
Type: ImportInstanceTaskDetailsType (p. 471)                          |
| state         | The state of the conversion task.  
Type: String  
Valid values: active | cancelling | cancelled | completed |
| statusMessage | The status message related to the conversion task.  
Type: String |

userId

The ID of an AWS account that can create volumes from the  
snapshot.  
Type: String
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>group</td>
<td>The group that is allowed to create volumes from the snapshot. Type: String</td>
</tr>
<tr>
<td></td>
<td>Valid value: all</td>
</tr>
</tbody>
</table>

**CustomerGatewayType**

Describes a customer gateway.

**Ancestors**

- CustomerGatewaySetType

**Relevant Operations**

- CreateCustomerGateway (p. 56)
- DescribeCustomerGateways (p. 174)

**Contents**

The following table describes the elements in this data type.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>customerGatewayId</td>
<td>The ID of the customer gateway. Type: String</td>
</tr>
<tr>
<td>state</td>
<td>The current state of the customer gateway. Type: String</td>
</tr>
<tr>
<td></td>
<td>Valid values: pending</td>
</tr>
<tr>
<td>type</td>
<td>The type of VPN connection the customer gateway supports (ipsec.1). Type: String</td>
</tr>
<tr>
<td>ipAddress</td>
<td>The Internet-routable IP address of the customer gateway’s outside interface. Type: String</td>
</tr>
<tr>
<td>bgpAsn</td>
<td>The customer gateway’s Border Gateway Protocol (BGP) Autonomous System Number (ASN). Type: Integer</td>
</tr>
<tr>
<td>tagSet</td>
<td>Any tags assigned to the resource, each one wrapped in an item element. Type: ResourceTagSetItemType (p. 511)</td>
</tr>
</tbody>
</table>
DescribeAddressesResponseItemType

Describes an IP address.

Ancestors

- DescribeAddressesResponseInfoType

Relevant Operations

- DescribeAddresses (p. 161)

Contents

The following table describes the elements in this data type.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>publicIp</td>
<td>The public IP address. Type: String</td>
</tr>
<tr>
<td>allocationId</td>
<td>The ID representing the allocation of the address for use with Amazon VPC. Type: String</td>
</tr>
<tr>
<td>domain</td>
<td>Whether this Elastic IP address is for EC2 instances (i.e., standard) or VPC instances. Type: String Valid values: standard</td>
</tr>
<tr>
<td>instanceId</td>
<td>The ID of the instance the address is associated with (if any). Type: String</td>
</tr>
<tr>
<td>associationId</td>
<td>The ID representing the association of a VPC Elastic IP address with an instance in a VPC. Type: String</td>
</tr>
<tr>
<td>networkInterfaceId</td>
<td>The ID of the network interface. Type: String</td>
</tr>
<tr>
<td>networkInterfaceOwnerId</td>
<td>The ID of the AWS account that owns the network interface. Type: String</td>
</tr>
</tbody>
</table>

DescribeImagesResponseItemType

The DescribeImagesResponseItemType data type.
### Ancestors

- DescribeImagesResponseInfoType

### Relevant Operations

- DescribeImages

### Contents

The following table describes the elements in this data type.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>imageId</code></td>
<td>The ID of the AMI. Type: String</td>
</tr>
<tr>
<td><code>imageLocation</code></td>
<td>The location of the AMI. Type: String</td>
</tr>
<tr>
<td><code>imageState</code></td>
<td>Current state of the AMI. If the operation returns <code>available</code>, the image is successfully registered and available for launching. Type: String. Valid values: available</td>
</tr>
<tr>
<td><code>imageOwnerId</code></td>
<td>AWS account ID of the image owner. Type: String</td>
</tr>
<tr>
<td><code>isPublic</code></td>
<td>Whether the image has public launch permissions. The value is <code>true</code> if this image has public launch permissions or <code>false</code> if it has only implicit and explicit launch permissions. Type: Boolean</td>
</tr>
<tr>
<td><code>productCodes</code></td>
<td>Any product codes associated with the AMI, each one wrapped in an item element. Type: ProductCodesSetItemType (p. 507)</td>
</tr>
<tr>
<td><code>architecture</code></td>
<td>The architecture of the image. Type: String</td>
</tr>
<tr>
<td><code>imageType</code></td>
<td>The type of image (machine, kernel, or RAM disk). Type: String</td>
</tr>
<tr>
<td><code>kernelId</code></td>
<td>The kernel associated with the image, if any. Only applicable for machine images. Type: String</td>
</tr>
<tr>
<td><code>ramdiskId</code></td>
<td>The RAM disk associated with the image, if any. Only applicable for machine images. Type: String</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>platform</td>
<td>The value is Windows for Windows AMIs; otherwise blank. Type: String</td>
</tr>
<tr>
<td>stateReason</td>
<td>The reason for the state change. Type: StateReasonType (p. 523)</td>
</tr>
<tr>
<td>imageOwnerAlias</td>
<td>The AWS account alias (e.g., amazon, self, etc.) or AWS account ID that owns the AMI. Type: String</td>
</tr>
<tr>
<td>name</td>
<td>The name of the AMI that was provided during image creation. Type: String</td>
</tr>
<tr>
<td>description</td>
<td>The description of the AMI that was provided during image creation. Type: String</td>
</tr>
<tr>
<td>rootDeviceType</td>
<td>The type of root device used by the AMI. The AMI can use an Amazon EBS volume or an instance store volume. Type: String Valid values: ebs</td>
</tr>
<tr>
<td>rootDeviceName</td>
<td>The device name of the root device (e.g., /dev/sda1, or xvda). Type: String</td>
</tr>
<tr>
<td>blockDeviceMapping</td>
<td>Any block device mapping entries, each one wrapped in an item element. Type: BlockDeviceMappingItemType (p. 444)</td>
</tr>
<tr>
<td>virtualizationType</td>
<td>The type of virtualization of the AMI. Type: String Valid values: paravirtual</td>
</tr>
<tr>
<td>tagSet</td>
<td>Any tags assigned to the resource, each one wrapped in an item element. Type: ResourceTagSetItemType (p. 511)</td>
</tr>
<tr>
<td>hypervisor</td>
<td>The image's hypervisor type. Type: String Valid values: ovm</td>
</tr>
</tbody>
</table>

**DescribeKeyPairsResponseItemType**

The DescribeKeyPairsResponseItemType data type.

**Ancestors**

- DescribeKeyPairsResponseInfoType
**Relevant Operations**

- DescribeKeyPairs

**Contents**

The following table describes the elements in this data type.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>

- RunInstances (p. 417)

Contents

The following table describes the elements in this data type.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>networkInterfaceId</td>
<td>The ID of the network interface. Type: String</td>
</tr>
<tr>
<td>subnetId</td>
<td>The ID of the subnet. Type: String</td>
</tr>
<tr>
<td>vpcId</td>
<td>The ID of the VPC. Type: String</td>
</tr>
<tr>
<td>description</td>
<td>The description. Type: String</td>
</tr>
<tr>
<td>ownerId</td>
<td>The ID of the customer who created the network interface. Type: String</td>
</tr>
<tr>
<td>status</td>
<td>The network interface's status (available or in-use). Type: String</td>
</tr>
<tr>
<td>privateIpAddress</td>
<td>The IP address of the network interface within the subnet. Type: String</td>
</tr>
<tr>
<td>privateDnsName</td>
<td>The private DNS name. Type: String</td>
</tr>
<tr>
<td>sourceDestCheck</td>
<td>Whether to validate network traffic to or from this network interface. Type: Boolean</td>
</tr>
<tr>
<td>groupSet.item</td>
<td>A security group. Type: GroupItemType (p. 469)</td>
</tr>
<tr>
<td>attachment</td>
<td>The network interface attachment. Type: InstanceNetworkInterfaceAttachmentType (p. 479)</td>
</tr>
<tr>
<td>association</td>
<td>The association information for an Elastic IP associated with the network interface. Type: InstanceNetworkInterfaceAssociationType (p. 478)</td>
</tr>
<tr>
<td>privateIpAddressesSet</td>
<td>The private IP addresses associated with the network interface. Type: InstancePrivateIpAddressesSetItemType (p. 482)</td>
</tr>
</tbody>
</table>
**InstancePrivateIpAddressesSetItemType**

Describes a private IP address.

**Ancestors**

- InstancePrivateIpAddressesSetType

**Relevant Operations**

- DescribeInstances (p. 197)
- RunInstances (p. 417)

**Contents**

The following table describes the elements in this data type.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>privateIpAddress</td>
<td>The private IP address of the network interface</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
</tr>
<tr>
<td>primary</td>
<td>Whether this IP address is the primary private IP address of the network interface.</td>
</tr>
<tr>
<td></td>
<td>Type: Boolean</td>
</tr>
<tr>
<td>association</td>
<td>The association information for an Elastic IP address associated with the network interface.</td>
</tr>
<tr>
<td></td>
<td>Type: InstanceNetworkInterfaceAssociationType (p. 478)</td>
</tr>
</tbody>
</table>

**InstanceStateChangeType**

Describes an instance state change.

**Ancestors**

- InstanceStateChangeSetType

**Relevant Operations**

- StartInstances (p. 428)
- StopInstances (p. 430)
- TerminateInstances (p. 432)
Contents

The following table describes the elements in this data type.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>instanceId</td>
<td>The instance ID. Type: String</td>
</tr>
<tr>
<td>currentState</td>
<td>The current state of the instance. Type: InstanceStateType (p. 483)</td>
</tr>
<tr>
<td>previousState</td>
<td>The previous state of the instance. Type: InstanceStateType (p. 483)</td>
</tr>
</tbody>
</table>

InstanceStateType

Describes the current state of the instance.

Ancestors

- InstanceStateChangeType (p. 482)
- RunningInstancesItemType (p. 514)

Relevant Operations

- DescribeInstances (p. 197)
- DescribeInstanceStatus (p. 214)
- RunInstances (p. 417)
- StartInstances (p. 428)
- StopInstances (p. 430)
- TerminateInstances (p. 432)

Contents

The following table describes the elements in this data type.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>code</td>
<td>The low byte represents the state. The high byte is an opaque internal value</td>
</tr>
<tr>
<td></td>
<td>and should be ignored. Type: Integer (16-bit unsigned) Valid values: 0 (</td>
</tr>
<tr>
<td></td>
<td>pending)</td>
</tr>
</tbody>
</table>
### InstanceStatusDetailsSetType

The InstanceStatusType data type.

#### Ancestors

- InstanceStatusItemSetType (p. 485)
- InstanceStatusType (p. 487)

#### Relevant Operations

- DescribeInstanceStatus (p. 214)

#### Contents

The following table describes the elements in this data type.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| name        | The type of instance status detail. Type: String  
Valid values: reachability |
| status      | The status. Type: String  
Valid values: passed | failed | insufficient-data |
| impairedSince | The time when a status check failed. For an instance that was launched and impaired, this is the time when the instance was launched. Type: DateTime |

### InstanceStatusEventsSetType

Describes a set of events.

#### Relevant Operations

- DescribeInstanceStatus (p. 214)
Contents

The following table describes the elements in this data type.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>item</td>
<td>Information about scheduled events for the instance. Type: InstanceStatusEventTyp (p. 485)</td>
</tr>
</tbody>
</table>

InstanceStatusEventType

Describes an event.

Ancestors

- InstanceStatusEventsSetType (p. 484)

Relevant Operations

- DescribeInstanceStatus (p. 214)

Contents

The following table describes the elements in this data type.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>code</td>
<td>The associated code of the event. Type: String</td>
</tr>
<tr>
<td></td>
<td>Valid parameters: instance-reboot</td>
</tr>
<tr>
<td>description</td>
<td>A description of the event. Type: String</td>
</tr>
<tr>
<td>notBefore</td>
<td>The earliest scheduled start time for the event. Type: DateTime</td>
</tr>
<tr>
<td>notAfter</td>
<td>The latest scheduled end time for the event. Type: DateTime</td>
</tr>
</tbody>
</table>

InstanceStatusItemType

Describes the status of an instance.
Ancestors

- InstanceStatusSetType

Relevant Operations

- DescribeInstanceStatus (p. 214)

Contents

The following table describes the elements in this data type.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>instanceId</td>
<td>The ID of the instance. Type: String</td>
</tr>
<tr>
<td>availabilityZone</td>
<td>The Availability Zone of the instance. Type: String</td>
</tr>
<tr>
<td>eventsSet</td>
<td>Extra information regarding events associated with the instance. Type: InstanceStatusEventsSetType (p. 484)</td>
</tr>
<tr>
<td>instanceState</td>
<td>The intended state of the instance. Calls to DescribeInstanceStatus require that an instance be in the running state. Type: InstanceStateType (p. 483)</td>
</tr>
<tr>
<td>systemStatus</td>
<td>Reports impaired functionality that stems from issues related to the systems that support an instance, such as hardware failures and network connectivity problems. Type: InstanceStatusType (p. 487)</td>
</tr>
<tr>
<td>instanceStatus</td>
<td>Reports impaired functionality that arises from problems internal to the instance. The DescribeInstanceStatus (p. 214) response elements report such problems as impaired reachability. Type: InstanceStatusType (p. 487)</td>
</tr>
</tbody>
</table>

InstanceStatusSetType

The InstanceStatusSetType data type.

Relevant Operations

- DescribeInstanceStatus (p. 214)
### Contents

The following table describes the elements in this data type.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>item</td>
<td>Information about the status of the instance. Type: InstanceStatusItemType (p. 485)</td>
</tr>
</tbody>
</table>

### InstanceStatusType

Describes the state of an instance.

#### Ancestors

- InstanceStatusItemType (p. 485)

#### Relevant Operations

- DescribeInstanceStatus (p. 214)

### Contents

The following table describes the elements in this data type.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>status</td>
<td>The status. Type: String Valid values: ok</td>
</tr>
<tr>
<td>details</td>
<td>Information about system instance health or application instance health. Type: InstanceStatusDetailsSetType (p. 484)</td>
</tr>
</tbody>
</table>

### InternetGatewayAttachmentType

Describes the VPC attached to an Internet gateway.

#### Ancestors

- InternetGatewayAttachmentSetType
**Relevant Operations**

- AttachInternetGateway (p. 25)
- CreateInternetGateway (p. 67)
- DescribeInternetGateways (p. 221)

**Contents**

The following table describes the elements in this data type.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>vpcId</td>
<td>The ID of the VPC the Internet gateway is attached to. Type: String</td>
</tr>
<tr>
<td>state</td>
<td>The current state of the attachment. Type: String</td>
</tr>
<tr>
<td></td>
<td>Valid values: attaching</td>
</tr>
</tbody>
</table>

**InternetGatewayType**

Describes an Internet gateway.

**Ancestors**

- InternetGatewaySetType

**Relevant Operations**

- CreateInternetGateway (p. 67)
- DescribeInternetGateways (p. 221)

**Contents**

The following table describes the elements in this data type.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>internetGatewayId</td>
<td>The ID of the Internet gateway. Type: String</td>
</tr>
<tr>
<td>attachmentSet</td>
<td>Any VPCs attached to the Internet gateway, each one wrapped in an item element. Type: InternetGatewayAttachmentType (p. 487)</td>
</tr>
</tbody>
</table>
**IpPermissionType**

The IpPermissionType data type.

**Ancestors**

- IpPermissionSetType

**Relevant Operations**

- AuthorizeSecurityGroupIngress
- RevokeSecurityGroupIngress
- DescribeSecurityGroups

**Contents**

The following table describes the elements in this data type.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>tagSet</strong></td>
<td>Any tags assigned to the resource, each one wrapped in an item element. Type: ResourceTagSetItemType (p. 511)</td>
</tr>
<tr>
<td><strong>ipProtocol</strong></td>
<td>The protocol. When you call DescribeSecurityGroups, the protocol value returned is the number. Exception: For TCP, UDP, and ICMP, the value returned is the name (e.g., tcp, udp, or icmp). For a list of protocol numbers, see Protocol Numbers. Type: String</td>
</tr>
<tr>
<td><strong>fromPort</strong></td>
<td>The start of port range for the TCP and UDP protocols, or an ICMP type number. A value of -1 indicates all ICMP types. Type: Integer</td>
</tr>
<tr>
<td><strong>toPort</strong></td>
<td>The end of port range for the TCP and UDP protocols, or an ICMP code. A value of -1 indicates all ICMP codes for the given ICMP type. Type: Integer</td>
</tr>
<tr>
<td><strong>groups</strong></td>
<td>A list of security group and AWS account ID pairs. Each pair is wrapped in an item element. Type: UserIdGroupPairType (p. 527)</td>
</tr>
<tr>
<td><strong>ipRanges</strong></td>
<td>A list of IP ranges. Each range is wrapped in an item element. Type: IpRangeItemType (p. 490)</td>
</tr>
</tbody>
</table>
IpRangeItemType

Describes an IP range.

Ancestors

- IpRangeSetType

Relevant Operations

- AuthorizeSecurityGroupIngress
- RevokeSecurityGroupIngress
- DescribeSecurityGroups

Contents

The following table describes the elements in this data type.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cidrIp</td>
<td>The CIDR range. Cannot be used when specifying a source security group.</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
</tr>
</tbody>
</table>

LaunchPermissionItemType

The LaunchPermissionItemType data type.

Ancestors

- LaunchPermissionListType

Relevant Operations

- DescribeImageAttribute
- ModifyImageAttribute

Contents

The following table describes the elements in this data type.
LaunchSpecificationRequestType

The LaunchSpecificationRequestType data type.

Ancestors

- RequestSpotInstancesType

Relevant Operations

- RequestSpotInstances

Contents

The following table describes the elements in this data type.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>imageId</td>
<td>The AMI ID.                     Type: String</td>
</tr>
<tr>
<td>keyName</td>
<td>The name of the key pair.            Type: String</td>
</tr>
<tr>
<td>groupSet</td>
<td>A list of security groups. Each group is wrapped in an item element.    Type: GroupItemType (p. 469)</td>
</tr>
<tr>
<td>userData</td>
<td>Base64-encoded MIME user data made available to the instance(s) in the reservation. Type: UserDataType (p. 526)</td>
</tr>
<tr>
<td>addressingType</td>
<td>Deprecated. Type: String</td>
</tr>
<tr>
<td>instanceType</td>
<td>The instance type. Type: String</td>
</tr>
<tr>
<td>placement</td>
<td>The placement information for the instance. Type: PlacementRequestType (p. 501)</td>
</tr>
</tbody>
</table>
### LaunchSpecificationResponseType

The LaunchSpecificationResponseType data type.

#### Ancestors

- SpotInstanceRequestSetItemType (p. 520)

#### Relevant Operations

- DescribeSpotInstanceRequests

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>kernelId</td>
<td>The ID of the kernel to select. Type: String</td>
</tr>
<tr>
<td>ramdiskId</td>
<td>The ID of the RAM disk to select. Some kernels require additional drivers at launch. Check the kernel requirements for information on whether you need to specify a RAM disk and search for the kernel ID. Type: String</td>
</tr>
<tr>
<td>blockDeviceMapping</td>
<td>Any block device mapping entries for the instance. Each entry is wrapped in an item element. Type: BlockDeviceMappingItemType (p. 444)</td>
</tr>
<tr>
<td>monitoring</td>
<td>The monitoring information for the instance. Type: MonitoringInstanceType (p. 494)</td>
</tr>
<tr>
<td>subnetId</td>
<td>The Amazon VPC subnet ID within which to launch the instance(s) for Amazon Virtual Private Cloud. Type: String</td>
</tr>
<tr>
<td>networkInterfaceSet</td>
<td>The network interfaces associated with the instance. Type: InstanceNetworkInterfaceSetItemRequestType (p. 479)</td>
</tr>
<tr>
<td>iamInstanceProfile</td>
<td>The IAM Instance Profile (IIP) associated with the instance. Type: iamInstanceProfileRequestType (p. 469)</td>
</tr>
<tr>
<td>ebsOptimized</td>
<td>Whether the instance is optimized for EBS I/O. This optimization provides dedicated throughput to Amazon EBS and an optimized configuration stack to provide optimal EBS I/O performance. This optimization isn’t available with all instance types. Additional usage charges apply when using an EBS Optimized instance. Type: Boolean Default: false</td>
</tr>
</tbody>
</table>

**LaunchSpecificationResponseType**

The LaunchSpecificationResponseType data type.

**Ancestors**

- SpotInstanceRequestSetItemType (p. 520)

**Relevant Operations**

- DescribeSpotInstanceRequests
The following table describes the elements in this data type.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>imageId</td>
<td>The AMI ID. Type: String</td>
</tr>
<tr>
<td>keyName</td>
<td>The name of the key pair. Type: String</td>
</tr>
<tr>
<td>groupSet</td>
<td>A list of security groups. Each group is wrapped in an <code>item</code> element. Type: <code>GroupItemType</code> (p. 469)</td>
</tr>
<tr>
<td>addressingType</td>
<td>Deprecated. Type: String</td>
</tr>
<tr>
<td>instanceType</td>
<td>The instance type. Type: String</td>
</tr>
<tr>
<td>placement</td>
<td>The placement information for the instance. Type: <code>PlacementRequestType</code> (p. 501)</td>
</tr>
<tr>
<td>kernelId</td>
<td>The ID of the kernel to select. Type: String</td>
</tr>
<tr>
<td>ramdiskId</td>
<td>The ID of the RAM disk to select. Some kernels require additional drivers at launch. Check the kernel requirements for information on whether you need to specify a RAM disk and search for the kernel ID. Type: String</td>
</tr>
<tr>
<td>blockDeviceMapping</td>
<td>Any block device mapping entries for the instance. Each entry is wrapped in an <code>item</code> element. Type: <code>BlockDeviceMappingItemType</code> (p. 444)</td>
</tr>
<tr>
<td>monitoring</td>
<td>The monitoring information for the instance. Type: <code>MonitoringInstanceType</code> (p. 494)</td>
</tr>
<tr>
<td>subnetId</td>
<td>The Amazon VPC subnet ID within which to launch the instance(s) for Amazon Virtual Private Cloud. Type: String</td>
</tr>
<tr>
<td>networkInterfaceSet</td>
<td>The network interfaces for the instance. Type: <code>InstanceNetworkInterfaceSetItemRequestType</code> (p. 479)</td>
</tr>
<tr>
<td>iamInstanceProfile</td>
<td>The IAM Instance Profile (IIP) associated with the instance. Type: <code>iamInstanceProfileRequestType</code> (p. 469)</td>
</tr>
</tbody>
</table>
Whether the instance is optimized for EBS I/O. This optimization provides dedicated throughput to Amazon EBS and an optimized configuration stack to provide optimal EBS I/O performance. This optimization isn’t available with all instance types. Additional usage charges apply when using an EBS Optimized instance.

Type: Boolean

Default: false

### MonitoringInstanceType

The MonitoringInstanceType data type.

### Ancestors

- LaunchSpecificationRequestType (p. 491)
- LaunchSpecificationResponseType (p. 492)
- RunInstancesType

### Relevant Operations

- RequestSpotInstances
- DescribeSpotInstanceRequests
- RequestSpotInstances
- RunInstances

### Contents

The following table describes the elements in this data type.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ebsOptimized</td>
<td>Whether the instance is optimized for EBS I/O. This optimization provides dedicated throughput to Amazon EBS and an optimized configuration stack to provide optimal EBS I/O performance. This optimization isn’t available with all instance types. Additional usage charges apply when using an EBS Optimized instance. Type: Boolean Default: false</td>
</tr>
</tbody>
</table>

### MonitorInstancesResponseSetItemType

The MonitorInstancesResponseSetItemType data type.

### Ancestors

- MonitorInstancesResponseSetType
Relevant Operations

- MonitorInstances
- UnmonitorInstances

Contents

The following table describes the elements in this data type.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>instanceId</td>
<td>The instance ID. Type: String</td>
</tr>
<tr>
<td>monitoring</td>
<td>The monitoring information. Type: InstanceMonitoringStateType (p. 477)</td>
</tr>
</tbody>
</table>

NetworkAclAssociationType

Describes an association between a network ACL and a subnet.

Ancestors

- NetworkAclAssociationSetType

Relevant Operations

- CreateNetworkAcl (p. 71)
- DescribeNetworkAcls (p. 227)

Contents

The following table describes the elements in this data type.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>networkAclAssociationId</td>
<td>An identifier representing the association between a network ACL and a subnet. Type: String</td>
</tr>
<tr>
<td>networkAclId</td>
<td>The ID of the network ACL in the association. Type: String</td>
</tr>
<tr>
<td>subnetId</td>
<td>The ID of the subnet in the association. Type: String</td>
</tr>
</tbody>
</table>
NetworkAclEntryType

Describes an entry in a network ACL.

Ancestors

• NetworkAclEntrySetType

Relevant Operations

• CreateNetworkAcl (p. 71)
• DescribeNetworkAcls (p. 227)

Contents

The following table describes the elements in this data type.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ruleNumber</td>
<td>The rule number for the entry. ACL entries are processed in ascending order by rule number. Type: Integer</td>
</tr>
<tr>
<td>protocol</td>
<td>The protocol. A value of -1 means all protocols. Type: Integer Valid values: Any protocol number (see Protocol Numbers).</td>
</tr>
<tr>
<td>ruleAction</td>
<td>Whether to allow or deny the traffic that matches the rule. Type: String</td>
</tr>
<tr>
<td>egress</td>
<td>Indicates an egress rule (rule is applied to traffic leaving the subnet). Value of true indicates egress. Type: Boolean</td>
</tr>
<tr>
<td>cidrBlock</td>
<td>The network range to allow or deny, in CIDR notation. Type: String</td>
</tr>
<tr>
<td>icmpTypeCode</td>
<td>ICMP protocol: The ICMP type and code. Type: IcmpTypeCodeType (p. 471)</td>
</tr>
<tr>
<td>portRange</td>
<td>TCP or UDP protocols: The range of ports the rule applies to. Type: PortRangeType (p. 502)</td>
</tr>
</tbody>
</table>

NetworkAclType

Describes a network ACL.
Ancestors

- NetworkAclSetType

Relevant Operations

- CreateNetworkAcl (p. 71)
- DescribeNetworkAcls (p. 227)

Contents

The following table describes the elements in this data type.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>networkAclId</td>
<td>The ID of the network ACL. Type: String</td>
</tr>
<tr>
<td>vpcId</td>
<td>The ID of the VPC the network ACL is in. Type: String</td>
</tr>
<tr>
<td>default</td>
<td>Whether this is the default network ACL in the VPC. Type: Boolean</td>
</tr>
<tr>
<td>entrySet</td>
<td>A list of entries (rules) in the network ACL. Each entry is wrapped in an item element. Type: NetworkAclEntryType (p. 496)</td>
</tr>
<tr>
<td>associationSet</td>
<td>A list of associations between the network ACL and one or more subnets. Each association is wrapped in an item element. Type: NetworkAclAssociationType (p. 495)</td>
</tr>
<tr>
<td>tagSet</td>
<td>Any tags assigned to the resource, each one wrapped in an item element. Type: ResourceTagSetItemType (p. 511)</td>
</tr>
</tbody>
</table>

NetworkInterfaceAssociationType

Describes association information for a VPC Elastic IP address.

Ancestors

- InstanceNetworkInterfaceSetItemType

Relevant Operations

- CreateNetworkInterface (p. 76)
Contents

The following table describes the elements in this data type.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>attachmentID</td>
<td>The ID of the network interface attachment. Type: String</td>
</tr>
<tr>
<td>instanceID</td>
<td>The ID of the instance attached to the network interface. Type: String</td>
</tr>
<tr>
<td>publicIp</td>
<td>The address of the Elastic IP address bound to the network interface. Type: String</td>
</tr>
<tr>
<td>ipOwnerId</td>
<td>The ID of the Elastic IP address owner. Type: String</td>
</tr>
</tbody>
</table>

NetworkInterfaceAttachmentType

Describes a network interface attachment.

Relevant Operations

- CreateNetworkInterface (p. 76)
- DescribeNetworkInterfaces (p. 235)

Contents

The following table describes the elements in this data type.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>attachmentID</td>
<td>The ID of the network interface attachment. Type: String</td>
</tr>
<tr>
<td>instanceID</td>
<td>The ID of the instance. Type: String</td>
</tr>
</tbody>
</table>

NetworkInterfacePrivateIpAddressesSetItemType

Describes the private IP address of a network interface.
Relevant Operations

- DescribeNetworkInterfaces

Contents

The following table describes the elements in this data type.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>privateIpAddress</td>
<td>The private IP address of the network interface. Type: String</td>
</tr>
<tr>
<td>primary</td>
<td>Whether this IP address is the primary private IP address of the network interface. Type: Boolean</td>
</tr>
<tr>
<td>association</td>
<td>The association information for an Elastic IP address associated with the network interface. Type: NetworkInterfaceAssociationType (p. 497)</td>
</tr>
</tbody>
</table>

NetworkInterfaceType

Describes a network interface.

Ancestors

- NetworkInterfaceSetType

Relevant Operations

- CreateNetworkInterface (p. 76)
- DescribeNetworkInterfaces (p. 235)

Contents

The following table describes the elements in this data type.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>networkInterfaceId</td>
<td>The ID of the network interface. Type: String</td>
</tr>
<tr>
<td>subnetId</td>
<td>The ID of the subnet. Type: String</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>vpcId</td>
<td>The ID of the VPC. Type: String</td>
</tr>
<tr>
<td>availabilityZone</td>
<td>The Availability Zone. Type: String</td>
</tr>
<tr>
<td>description</td>
<td>A description. Type: String</td>
</tr>
<tr>
<td>ownerId</td>
<td>The ID of the customer who created the interface. Type: String</td>
</tr>
<tr>
<td>requesterId</td>
<td>The ID of the entity that launched the instance on your behalf (for example, AWS Management Console or Auto Scaling) Type: String</td>
</tr>
<tr>
<td>requesterManaged</td>
<td>Type: String</td>
</tr>
<tr>
<td>status</td>
<td>The status (available or in-use). Type: String</td>
</tr>
<tr>
<td>privateIpAddress</td>
<td>The IP address of the interface within the subnet. Type: String</td>
</tr>
<tr>
<td>privateDnsName</td>
<td>The private DNS name. Type: String</td>
</tr>
<tr>
<td>sourceDestCheck</td>
<td>Whether traffic to or from the instance is validated. Type: Boolean</td>
</tr>
<tr>
<td>groupSet</td>
<td>The security group. Type: GroupItemType (p. 469)</td>
</tr>
<tr>
<td>attachment</td>
<td>The network interface attachment. Type: NetworkInterfaceAttachmentType (p. 498)</td>
</tr>
<tr>
<td>association</td>
<td>The association information for an Elastic IP associated with the network interface. Type: NetworkInterfaceAssociationType (p. 497)</td>
</tr>
<tr>
<td>tagSet</td>
<td>The tags assigned to the resource. Type: ResourceTagSetItemType (p. 511)</td>
</tr>
<tr>
<td>privateIpAddressesSet</td>
<td>The private IP addresses associated with the network interface. Items are returned in a set. Type: NetworkInterfacePrivateIpAddressesSetItemType</td>
</tr>
</tbody>
</table>

**PlacementGroupInfoType**

Describes a placement group.
Ancestors

- PlacementGroupSetType

Relevant Operations

- DeletePlacementGroup (p. 133)

Contents

The following table describes the elements in this data type.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>groupName</td>
<td>The name of the placement group. Type: String</td>
</tr>
<tr>
<td>strategy</td>
<td>The placement strategy. Type: String Valid values: cluster</td>
</tr>
<tr>
<td>state</td>
<td>The status of the placement group. Type: String Valid values: pending</td>
</tr>
</tbody>
</table>

PlacementRequestType

The PlacementRequestType data type.

Ancestors

- LaunchSpecificationRequestType (p. 491)
- LaunchSpecificationResponseType (p. 492)
- RunInstancesType

Relevant Operations

- RequestSpotInstances
- DescribeSpotInstanceRequests
- RequestSpotInstances
- RunInstances
Contents

The following table describes the elements in this data type.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>availabilityZone</td>
<td>The Availability Zone for launching the instance.</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
</tr>
<tr>
<td>groupName</td>
<td>The name of a placement group for the instance.</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
</tr>
</tbody>
</table>

PlacementResponseType

The PlacementResponseType data type.

Ancestors

- RunningInstancesItemType (p. 514)

Relevant Operations

- DescribeInstances
- RunInstances

Contents

The following table describes the elements in this data type.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>availabilityZone</td>
<td>The Availability Zone of the instance.</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
</tr>
<tr>
<td>groupName</td>
<td>The name of the placement group the instance is in (for cluster compute instances).</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
</tr>
<tr>
<td>tenancy</td>
<td>The tenancy of the instance (if the instance is running within a VPC).</td>
</tr>
<tr>
<td></td>
<td>An instance with a tenancy of dedicated runs on single-tenant hardware.</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
</tr>
</tbody>
</table>

PortRangeType

Describes a range of ports.
**Ancestors**

- NetworkAclEntryType (p. 496)

**Relevant Operations**

- DescribeNetworkAcls (p. 227)

**Contents**

The following table describes the elements in this data type.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>from</td>
<td>The first port in the range. Type: Integer</td>
</tr>
<tr>
<td>to</td>
<td>The last port in the range. Type: Integer</td>
</tr>
</tbody>
</table>

**PriceScheduleRequestSetItemType**

The PriceScheduleRequestSetItemType data type.

**Ancestors**

- PriceScheduleRequestSetType

**Relevant Operations**

- CreateReservedInstancesListing

**Contents**

The following table describes the elements in this data type.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>term</td>
<td>The number of months remaining in the reservation. For example, 2 is the second to the last month before the capacity reservation expires. Type: Long</td>
</tr>
<tr>
<td>price</td>
<td>The fixed price for the term. Type: Double</td>
</tr>
</tbody>
</table>
PriceScheduleSetItemType

The PriceScheduleSetItemType data type.

Ancestors

<tr>
<td></td>
<td>Valid values: Linux/UNIX</td>
</tr>
</tbody>
</table>

PropagatingVgwType

Describes a virtual private gateway propagating route.

Ancestors

- PropagatingVgwSetType

Relevant Operations

- CreateRouteTable (p. 90)
- DescribeRouteTables (p. 265)

Contents

The following table describes the elements in this data type.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>gatewayID</td>
<td>The ID of the virtual private gateway (VGW).</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
</tr>
</tbody>
</table>

RecurringChargesSetItemType

The RecurringChargesSetItemType data type.

Relevant Operations

- DescribeReservedInstances
- DescribeReservedInstanceOfferings
The following table describes the elements in this data type.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>frequency</td>
<td>The frequency of the recurring charge. Type: String Valid value: Hourly</td>
</tr>
<tr>
<td>amount</td>
<td>The amount of the recurring charge. Type: Double</td>
</tr>
</tbody>
</table>

**RegionItemType**

Describes a region.

**Ancestors**

- RegionSetType

**Relevant Operations**

- DescribeRegions (p. 245)

**Contents**

The following table describes the elements in this data type.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>regionName</td>
<td>The name of the Region. Type: String</td>
</tr>
<tr>
<td>regionEndpoint</td>
<td>The Region service endpoint. Type: String</td>
</tr>
</tbody>
</table>

**ReservationInfoType**

Describes a reservation.

**Ancestors**

- ReservationSetType
Relevant Operations

- DescribeInstances (p. 197)

Contents

The following table describes the elements in this data type.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reservationId</td>
<td>The ID of the reservation. Type: String</td>
</tr>
<tr>
<td>ownerId</td>
<td>The ID of the AWS account that owns the reservation. Type: String</td>
</tr>
<tr>
<td>groupSet</td>
<td>A list of security groups. Each group is wrapped in an item element. Type: GroupItemType (p. 469)</td>
</tr>
<tr>
<td>instancesSet</td>
<td>A list of instances. Each instance is wrapped in an item element. Type: RunningInstancesItemType (p. 514)</td>
</tr>
<tr>
<td>requesterId</td>
<td>The ID of the requester that launched the instances on your behalf (for example, AWS Management Console or Auto Scaling). Type: String</td>
</tr>
</tbody>
</table>

ReservedInstanceLimitPriceType

The ReservedInstanceLimitPriceType data type.

Ancestors

- PurchaseReservedInstancesOfferings

Relevant Operations

- DescribeReservedInstancesOfferingsResponseType

Contents

The following table describes the elements in this data type.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>amount</td>
<td>Used for Reserved Instance Marketplace offerings. Specifies the limit price on the total order (instanceCount * price). Type: Double</td>
</tr>
</tbody>
</table>
ResourceTagSetItemType

Describes the tags assigned to an EC2 resource.

Ancestors

- ResourceTagSetType

Relevant Operations

- DescribeImages
- DescribeInstances
- DescribeVolumes
- DescribeSnapshots
- DescribeSpotInstanceRequests

Contents

The following table describes the elements in this data type.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>key</td>
<td>The tag key. Type: String</td>
</tr>
<tr>
<td>value</td>
<td>The tag value. Type: String</td>
</tr>
</tbody>
</table>

RouteTableAssociationType

Describes an association between a route table and a subnet.

Ancestors

- RouteTableAssociationSetType
Relevant Operations

- CreateRouteTable (p. 90)
- DescribeRouteTables (p. 265)

Contents

The following table describes the elements in this data type.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>routeTableAssociationId</td>
<td>An identifier representing the association between a route table and a subnet. Type: String</td>
</tr>
<tr>
<td>routeTableId</td>
<td>The ID of the route table in the association. Type: String</td>
</tr>
<tr>
<td>subnetId</td>
<td>The ID of the subnet in the association. Type: String</td>
</tr>
<tr>
<td>main</td>
<td>Whether this is the main route table. Type: Boolean</td>
</tr>
</tbody>
</table>

RouteTableType

Describes a route table.

Ancestors

- RouteTableSetType

Relevant Operations

- CreateRouteTable (p. 90)
- DescribeRouteTables (p. 265)

Contents

The following table describes the elements in this data type.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>routeTableId</td>
<td>The route table's ID. Type: String</td>
</tr>
</tbody>
</table>
The following table describes the elements in this data type.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>vpcId</td>
<td>The ID of the VPC the route table is in.</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
</tr>
<tr>
<td>routeSet</td>
<td>A list of routes in the route table. Each route is wrapped in an item element.</td>
</tr>
<tr>
<td></td>
<td>Type: RouteType (p. 513)</td>
</tr>
<tr>
<td>associationSet</td>
<td>A list of associations between the route table and one or more subnets. Each association is wrapped in an item element.</td>
</tr>
<tr>
<td></td>
<td>Type: RouteTableAssociationType (p. 511)</td>
</tr>
<tr>
<td>propagatingVgwSet</td>
<td>The IDs of any virtual private gateways (VGW) propagating routes, each route wrapped in an item element.</td>
</tr>
<tr>
<td></td>
<td>Type: PropagatingVgwType (p. 508)</td>
</tr>
<tr>
<td>tagSet</td>
<td>Any tags assigned to the resource, each one wrapped in an item element.</td>
</tr>
<tr>
<td></td>
<td>Type: ResourceTagSetItemType (p. 511)</td>
</tr>
</tbody>
</table>

### RouteType

Describes a route in a route table.

#### Ancestors

- RouteSetType

#### Relevant Operations

- CreateRouteTable (p. 90)
- DescribeRouteTables (p. 265)

#### Contents

The following table describes the elements in this data type.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>destinationCidrBlock</td>
<td>The CIDR address block used for the destination match. For example: 0.0.0.0/0.</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
</tr>
<tr>
<td>gatewayId</td>
<td>The ID of a gateway attached to your VPC.</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
</tr>
<tr>
<td>instanceId</td>
<td>The ID of a NAT instance in your VPC.</td>
</tr>
<tr>
<td></td>
<td>Type: String</td>
</tr>
</tbody>
</table>
RunningInstancesItemType

Describes a running instance.

**Ancestors**

- RunningInstancesSetType

**Relevant Operations**

- DescribeInstances (p. 197)
- RunInstances (p. 417)

**Contents**

The following table describes the elements in this data type.
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>instanceId</td>
<td>The ID of the instance launched. Type: String</td>
</tr>
<tr>
<td>imageId</td>
<td>The ID of the AMI used to launch the instance. Type: String</td>
</tr>
<tr>
<td>instanceState</td>
<td>The current state of the instance. Type: InstanceStateType (p. 483)</td>
</tr>
<tr>
<td>privateDnsName</td>
<td>The private DNS name assigned to the instance. This DNS name can only be used inside the Amazon EC2 network. This element remains empty until the instance enters a running state. Type: String</td>
</tr>
<tr>
<td>dnsName</td>
<td>The public DNS name assigned to the instance. This DNS name is contactable from outside the Amazon EC2 network. This element remains empty until the instance enters a running state. Type: String</td>
</tr>
<tr>
<td>reason</td>
<td>The reason for the most recent state transition. This might be an empty string. Type: String</td>
</tr>
<tr>
<td>keyName</td>
<td>The key pair name, if this instance was launched with an associated key pair. Type: String</td>
</tr>
<tr>
<td>amiLaunchIndex</td>
<td>The AMI launch index, which can be used to find this instance within the launch group. Type: String</td>
</tr>
<tr>
<td>productCodes</td>
<td>The product codes attached to this instance. Each product code is wrapped in an item element. Type: ProductCodesSetItemType (p. 507)</td>
</tr>
<tr>
<td>instanceType</td>
<td>The instance type (for example, m1.small). Type: String</td>
</tr>
<tr>
<td>launchTime</td>
<td>The time the instance was launched. Type: DateTime</td>
</tr>
<tr>
<td>placement</td>
<td>The location where the instance launched. Type: PlacementResponseType (p. 502)</td>
</tr>
<tr>
<td>kernelId</td>
<td>The kernel associated with this instance. Type: String</td>
</tr>
<tr>
<td>ramdiskId</td>
<td>The RAM disk associated with this instance. Type: String</td>
</tr>
<tr>
<td>platform</td>
<td>The platform of the instance (e.g., Windows). Type: String</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>monitoring</td>
<td>The monitoring information for the instance. Type: InstanceMonitoringStateType (p. 477)</td>
</tr>
<tr>
<td>subnetId</td>
<td>The subnet ID in which the instance is running. Type: String</td>
</tr>
<tr>
<td>vpcId</td>
<td>The VPC in which the instance is running. Type: String</td>
</tr>
<tr>
<td>privateIpAddress</td>
<td>The private IP address assigned to the instance. Type: String</td>
</tr>
<tr>
<td>ipAddress</td>
<td>The IP address of the instance. Type: String</td>
</tr>
<tr>
<td>sourceDestCheck</td>
<td>Specifies whether to enable a Network Address Translation (NAT) instance in a VPC to perform NAT. This controls whether source/destination checking is enabled on the instance. A value of true means checking is enabled, and false means checking is disabled. The value must be false for the instance to perform NAT. For more information, go to NAT Instances in the Amazon Virtual Private Cloud User Guide. Type: Boolean</td>
</tr>
<tr>
<td>groupSet</td>
<td>A list of VPC security groups the instance is in. Each group is wrapped in an item element. Type: GroupItemType (p. 469)</td>
</tr>
<tr>
<td>stateReason</td>
<td>The reason for the most recent state transition. See StateReasonType (p. 523) for a listing of supported state change codes. Type: StateReasonType (p. 523)</td>
</tr>
<tr>
<td>architecture</td>
<td>The architecture of the image. Type: String Valid values: i386</td>
</tr>
<tr>
<td>rootDeviceType</td>
<td>The root device type used by the AMI. The AMI can use an Amazon EBS or instance store root device. Type: String Valid values: ebs</td>
</tr>
<tr>
<td>rootDeviceName</td>
<td>The root device name (e.g., /dev/sda1). Type: String</td>
</tr>
<tr>
<td>blockDeviceMapping</td>
<td>Any block device mapping entries for the instance, each one wrapped in an item element. Type: InstanceBlockDeviceMappingResponseItemType (p. 474)</td>
</tr>
<tr>
<td>instanceLifecycle</td>
<td>Whether this is a Spot Instance. Type: String Valid values: spot</td>
</tr>
</tbody>
</table>
### SecurityGroupIdSetItemType

The SecurityGroupIdSetItemType data type.

#### Ancestors

- LaunchSpecificationResponseType
- LaunchSpecificationRequestType
- InstanceNetworkInterfaceSetItemRequestType

#### Relevant Operations

- CreateNetworkInterface
- ModifyNetworkInterfaceAttribute
• ModifyInstanceAttribute
• RequestSpotInstances

SecurityGroupItemType

The SecurityGroupItemType data type.

Ancestors

• SecurityGroupSetType

Relevant Operations

• DescribeSecurityGroups

Contents

The following table describes the elements in this data type.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownerId</td>
<td>The AWS account ID of the owner of the security group. Type: String</td>
</tr>
<tr>
<td>groupId</td>
<td>The ID of the security group. Type: String</td>
</tr>
<tr>
<td>groupName</td>
<td>The name of the security group. Type: String</td>
</tr>
<tr>
<td>groupDescription</td>
<td>A description of the security group. Type: String</td>
</tr>
<tr>
<td>vpcId</td>
<td>The ID of the VPC the security group is in (for VPC security groups). Type: String</td>
</tr>
</tbody>
</table>
SpotDatafeedSubscriptionType

The SpotDatafeedSubscriptionType data type.

**Ancestors**

- CreateSpotDatafeedSubscriptionResponseType
- DescribeSpotDatafeedSubscriptionResponseType

**Relevant Operations**

- CreateSpotDatafeedSubscription
- DescribeSpotDatafeedSubscription

**Contents**

The following table describes the elements in this data type.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownerId</td>
<td>The AWS account ID of the account. Type: String</td>
</tr>
<tr>
<td>bucket</td>
<td>The Amazon S3 bucket where the Spot Instance datafeed is located. Type: String</td>
</tr>
<tr>
<td>prefix</td>
<td>The prefix that is prepended to datafeed files. Type: String</td>
</tr>
<tr>
<td>state</td>
<td>The state of the Spot Instance datafeed subscription. Type: String</td>
</tr>
<tr>
<td></td>
<td>Valid values: Active</td>
</tr>
</tbody>
</table>
SpotInstanceRequestSetItemType

The SpotInstanceRequestSetItemType data type.

Ancestors

- SpotInstanceRequestSetType

Relevant Operations

- DescribeSpotInstanceRequests
- RequestSpotInstances

Contents

The following table describes the elements in this data type.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>spotInstanceRequestId</td>
<td>The ID of the Spot Instance request. Type: String</td>
</tr>
<tr>
<td>spotPrice</td>
<td>The maximum hourly price for any Spot Instance launched to fulfill the request. Type: String</td>
</tr>
<tr>
<td>type</td>
<td>The Spot Instance request type. Type: String</td>
</tr>
<tr>
<td></td>
<td>Valid values: <code>one-time</code></td>
</tr>
<tr>
<td>state</td>
<td>The state of the Spot Instance request. Type: String</td>
</tr>
<tr>
<td></td>
<td>Valid values: <code>open</code></td>
</tr>
<tr>
<td>fault</td>
<td>The fault codes for the Spot Instance request, if any. Type: SpotInstanceStateFaultType (p. 521)</td>
</tr>
<tr>
<td>status</td>
<td>The status code and status message describing the Spot Instance request. Type: SpotInstanceStatusMessageType (p. 522)</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>validFrom</td>
<td>The start date of the request. If this is a one-time request, the request becomes active at this date and time and remains active until all instances launch, the request expires, or the request is canceled. If the request is persistent, the request becomes active at this date and time and remains active until it expires or is canceled. Type: DateTime</td>
</tr>
<tr>
<td>validUntil</td>
<td>The end date of the request. If this is a one-time request, the request remains active until all instances launch, the request is canceled, or this date is reached. If the request is persistent, it remains active until it is canceled or this date is reached. Type: DateTime</td>
</tr>
<tr>
<td>launchGroup</td>
<td>The instance launch group. Launch groups are Spot Instances that launch together and terminate together. Type: String</td>
</tr>
<tr>
<td>availabilityZoneGroup</td>
<td>The Availability Zone group. If you specify the same Availability Zone group for all Spot Instance requests, all Spot Instances are launched in the same Availability Zone. Type: String</td>
</tr>
<tr>
<td>launchedAvailabilityZone</td>
<td>The Availability Zone in which the bid is launched. Type: String</td>
</tr>
<tr>
<td>launchSpecification</td>
<td>Additional information for launching instances. Type: LaunchSpecificationResponseType (p. 492)</td>
</tr>
<tr>
<td>instanceId</td>
<td>The instance ID, if an instance has been launched to fulfill the Spot Instance request. Type: String</td>
</tr>
<tr>
<td>createTime</td>
<td>The time stamp when the Spot Instance request was created. Type: DateTime</td>
</tr>
<tr>
<td>productDescription</td>
<td>The product description associated with the Spot Instance. Type: String</td>

</tbody>
</table>

The following table lists the currently supported state reason codes.

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Server.SpotInstanceTermination</td>
<td>A Spot Instance was terminated due to an increase in the market price.</td>
</tr>
<tr>
<td>Server.InternalError</td>
<td>An internal error occurred during instance launch, resulting in termination.</td>
</tr>
<tr>
<td>Server.InsufficientInstanceCapacity</td>
<td>There was insufficient instance capacity to satisfy the launch request.</td>
</tr>
<tr>
<td>Client.InternalError</td>
<td>A client error caused the instance to terminate on launch.</td>
</tr>
<tr>
<td>Client.InstanceInitiatedShutdown</td>
<td>The instance initiated shutdown by a shutdown -h command issued from inside the instance.</td>
</tr>
<tr>
<td>Client.UserInitiatedShutdown</td>
<td>The instance was shutdown by a user via an API call.</td>
</tr>
<tr>
<td>Client.VolumeLimitExceeded</td>
<td>The volume limit was exceeded.</td>
</tr>
<tr>
<td>Client.InvalidSnapshot.NotFound</td>
<td>The specified snapshot was not found.</td>
</tr>
</tbody>
</table>

**SubnetType**

Describes a subnet.

**Ancestors**

- SubnetSetType
### Relevant Operations

- CreateSubnet (p. 99)

<tr>
<td>vpcId</td>
<td>The ID of the VPC. Type: String</td>
</tr>
<tr>
<td>state</td>
<td>The current state of the VPC. Type: String</td>
</tr>
<tr>
<td></td>
<td>Valid values: pending</td>
</tr>
<tr>
<td>cidrBlock</td>
<td>The CIDR block the VPC covers. Type: String</td>
</tr>
<tr>
<td>dhcpOptionsId</td>
<td>The ID of the set of DHCP options you've associated with the VPC (or default if the default options are associated with the VPC). Type: String</td>
</tr>
<tr>
<td>tagSet</td>
<td>Any tags assigned to the resource, each one wrapped in an item element. Type: ResourceTagSetItemType (p. 511)</td>
</tr>
<tr>
<td>instanceTenancy</td>
<td>The allowed tenancy of instances launched into the VPC. Type: String</td>
</tr>
</tbody>
</table>
VpnConnectionOptionsResponseType

Describes VPN connection options.

**Relevant Operations**

- CreateVpnConnection (p. 108)
- DescribeVpnConnections (p. 318)

**Contents**

The following table describes the elements in this data type.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>staticRoutesOnly</td>
<td>Indicates whether the VPN connection uses static routes only. Static routes must be used for devices that don’t support BGP. Type: Boolean</td>
</tr>
</tbody>
</table>

VpnConnectionType

Describes a VPN connection.

**Ancestors**

- VpnConnectionSetType

**Relevant Operations**

- CreateVpnConnection (p. 108)

### VpnGatewayType

Describes a virtual private gateway.

#### Ancestors

- VpnGatewaySetType

#### Relevant Operations

- CreateVpnGateway (p. 117)
- DescribeVpnGateways (p. 322)

#### Contents

The following table describes the elements in this data type.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>customerGatewayConfiguration</td>
<td>The configuration information for the VPN connection’s customer gateway (in the native XML format). This element is always present in the CreateVpnConnection response; however, it’s present in the DescribeVpnConnections response only if the VPN connection is in the pending or available state. Type: String</td>
</tr>
<tr>
<td>type</td>
<td>The type of VPN connection (ipsec.1). Type: String</td>
</tr>
<tr>
<td>customerGatewayId</td>
<td>The ID of the customer gateway at your end of the VPN connection. Type: String</td>
</tr>
<tr>
<td>vpnGatewayId</td>
<td>The ID of the virtual private gateway at the VPC end of the VPN connection. Type: String</td>
</tr>
<tr>
<td>tagSet</td>
<td>Any tags assigned to the resource, each one wrapped in an item element. Type: ResourceTagSetItemType (p. 511)</td>
</tr>
<tr>
<td>vgwTelemetry</td>
<td>Information about the virtual private gateway. Each gateway is wrapped in an item element. Type: VpnTunnelTelemetryType (p. 535)</td>
</tr>
<tr>
<td>options</td>
<td>The option set describing the VPN connection. Type: VpnConnectionOptionsResponseType (p. 532)</td>
</tr>
<tr>
<td>routes</td>
<td>The set of static routes associated with a VPN connection. Type: VpnStaticRouteType (p. 534)</td>
</tr>
</tbody>
</table>
### VpnStaticRouteType

Describes a static route for a VPN connection.

#### Ancestors

- VpnStaticRoutesSetType

#### Relevant Operations

- CreateVpnConnection (p. 108)
- DescribeVpnConnections (p. 318)

#### Contents

The following table describes the elements in this data type.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>destinationCidrBlock</td>
<td>The CIDR block associated with the local subnet of the customer data center. Type: String</td>
</tr>
</tbody>
</table>
**VpnTunnelTelemetryType**

Describes telemetry for a VPN tunnel.

**Ancestors**

- VgwTelemetryType

**Relevant Operations**

- CreateVpnConnection (p. 108)
- DescribeVpnConnections (p. 318)

**Contents**

The following table describes the elements in this data type.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source</td>
<td>Indicates how the routes were provided. Type: String Valid value: Static</td>
</tr>
<tr>
<td>state</td>
<td>The current state of the static route. Type: String Valid values: pending</td>
</tr>
<tr>
<td>outsideIpAddress</td>
<td>The Internet-routable IP address of the virtual private gateway's outside interface. Type: String</td>
</tr>
<tr>
<td>status</td>
<td>The status of the VPN tunnel. Type: String Valid values: UP</td>
</tr>
<tr>
<td>lastStatusChange</td>
<td>The date and time of the last change in status. Type: DateTime</td>
</tr>
<tr>
<td>statusMessage</td>
<td>If an error occurs, a description of the error. Type: String</td>
</tr>
<tr>
<td>acceptedRouteCount</td>
<td>The number of accepted routes. Type: Integer</td>
</tr>
</tbody>
</table>
Common Query Parameters

All Query actions share a set of common parameters that must be present in each call.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action</td>
<td>Indicates the action to perform. Example: RunInstances</td>
<td>Yes</td>
</tr>
<tr>
<td>Version</td>
<td>The API version to use, as specified in the WSDL. Example: 2012-10-01</td>
<td>Yes</td>
</tr>
<tr>
<td>AWSAccessKeyId</td>
<td>The Access Key ID for the request sender. This identifies the account which will be charged for usage of the service. The account with which the Access Key ID is associated must be signed up for Amazon EC2, or requests will not be accepted. Example: AKIAIOSFODNN7EXAMPLE</td>
<td>Yes</td>
</tr>
<tr>
<td>Timestamp</td>
<td>The date and time at which the request is signed, in the format YYYY-MM-DDThh:mm:ssZ. For more information, go to ISO 8601. Example: 2006-07-07T15:04:56Z</td>
<td>Yes</td>
</tr>
<tr>
<td>Expires</td>
<td>The date and time at which the signature included in the request expires, in the format YYYY-MM-DDThh:mm:ssZ. Example: 2006-07-07T15:04:56Z</td>
<td>Yes</td>
</tr>
<tr>
<td>SecurityToken</td>
<td>The temporary security token obtained through a call to AWS Security Token Service. For more information, go to Using Temporary Security Credentials in the Amazon Elastic Compute Cloud User Guide. Default: None Type: String</td>
<td>No</td>
</tr>
<tr>
<td>Signature</td>
<td>The request signature. For more information, go to Making Query Requests in the Amazon Elastic Compute Cloud User Guide. Example: Qnp14Qk/7tINHzfXCi7VEXAMPLE</td>
<td>Yes</td>
</tr>
</tbody>
</table>
### Name | Description | Required
--- | --- | ---
**SignatureMethod** | The hash algorithm you use to create the request signature. Valid values: HmacSHA256 | Yes
| | | | HmacSHA1. For more information, go to Making Query Requests in the Amazon Elastic Compute Cloud User Guide. | |
| | | | Example: HmacSHA256 | |
| **SignatureVersion** | The signature version you use to sign the request. Set this value to 2. For more information, go to Making Query Requests in the Amazon Elastic Compute Cloud User Guide. | Yes
| | | | Example: 2 | |

**Note**
The *Timestamp* parameter can be used instead of *Expires*. Requests must include either *Timestamp* or *Expires*, but cannot contain both.

Parameter values must be URL-encoded. This is true for any Query parameter passed to Amazon EC2 and is typically necessary in the *Signature* parameter. Some clients do this automatically, but this is not the norm.
Error Codes

Overview

There are two types of error codes: client and server.

Client error codes suggest that the error was caused by something the client did, such as an authentication failure or an invalid AMI identifier. In the SOAP API, these error codes are prefixed with *Client*. For example: *Client.AuthFailure*. In the Query API, these errors are accompanied by a 400-series HTTP response code.

Server error codes suggest a server-side issue caused the error and should be reported. In the SOAP API, these error codes are prefixed with *Server*. For example: *Server.Unavailable*. In the Query API, these errors are accompanied by a 500-series HTTP response code.

Summary of Client Error Codes

<table>
<thead>
<tr>
<th>Error Code</th>
<th>Description</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>AddressLimitExceeded</td>
<td>You’ve reached the limit on the number of elastic IP addresses your account can have.</td>
<td>Each AWS account has an EC2 elastic IP address limit. For new accounts, this limit is 5. If you need more than 5 EC2 elastic IP addresses, please complete the Amazon EC2 Elastic IP Address Request Form. We will ask you to think through your use case and help us understand your need for additional addresses. You have a separate limit for VPC elastic IP addresses (5). To request to increase the limit, complete the Amazon VPC Limits form.</td>
</tr>
<tr>
<td>Error Code</td>
<td>Description</td>
<td>Notes</td>
</tr>
<tr>
<td>----------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>--------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>AttachmentLimitExceeded</td>
<td>You've reached the limit on the number of Amazon EBS volumes that can be attached to a single instance.</td>
<td></td>
</tr>
<tr>
<td>AuthFailure</td>
<td>User not authorized.</td>
<td>You might be trying to run an AMI for which you do not have permission.</td>
</tr>
<tr>
<td>Blocked</td>
<td>The account is currently blocked.</td>
<td>Contact <a href="mailto:aws-verification@amazon.com">aws-verification@amazon.com</a> if you have questions.</td>
</tr>
<tr>
<td>CustomerGatewayLimitExceeded</td>
<td>You've reached the limit on the number of customer gateways you can create.</td>
<td></td>
</tr>
<tr>
<td>DependencyViolation</td>
<td>The specified object has dependent resources.</td>
<td></td>
</tr>
<tr>
<td>DiskImageSizeTooLarge</td>
<td>The disk image exceeds the allowed limit (for instance or volume import).</td>
<td></td>
</tr>
<tr>
<td>FilterLimitExceeded</td>
<td>Request uses too many filters or too many total filter values.</td>
<td></td>
</tr>
<tr>
<td>Gateway.NotAttached</td>
<td>Specified gateway isn't attached, so it can't be detached.</td>
<td></td>
</tr>
<tr>
<td>IdempotentParameterMismatch</td>
<td>Request uses the same client token as a previous, but non-identical request.</td>
<td>Do not reuse a client token with different requests, unless the requests are identical.</td>
</tr>
<tr>
<td>IncorrectInstanceState</td>
<td>Instance is in an incorrect state so the attempted action cannot occur.</td>
<td></td>
</tr>
<tr>
<td>IncorrectState</td>
<td>Volume is in an incorrect state.</td>
<td>To attach to an instance, it must be in the 'available' state.</td>
</tr>
<tr>
<td>InstanceLimitExceeded</td>
<td>Account has maximum allowed concurrent running instances.</td>
<td>Each AWS account has a concurrent running instance limit. For new accounts, this limit is 20. If you need more than 20 instances, please complete the Amazon EC2 Instance Request Form and your request will be considered.</td>
</tr>
<tr>
<td>InsufficientInstanceCapacity</td>
<td>There is insufficient capacity available for the requested instance type.</td>
<td>The returned message gives guidance on how to solve the problem.</td>
</tr>
<tr>
<td>Error Code</td>
<td>Description</td>
<td>Notes</td>
</tr>
<tr>
<td>---------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>----------------------------------------------------------------------</td>
</tr>
<tr>
<td>InsufficientReservedInstancesCapacity</td>
<td>Insufficient Reserved Instances capacity.</td>
<td></td>
</tr>
<tr>
<td>InternetGatewayLimitExceeded</td>
<td>You've reached the limit on the number of Internet gateways you can create.</td>
<td></td>
</tr>
<tr>
<td>InvalidAMIAttributeItemValue</td>
<td>The value of an item added to, or removed from, an image attribute is invalid.</td>
<td>If you are specifying a userId, check that it is in the form of an AWS account ID.</td>
</tr>
<tr>
<td>InvalidAMIID.Malformed</td>
<td>Specified AMI ID is not valid.</td>
<td></td>
</tr>
<tr>
<td>InvalidAMIID.NotFound</td>
<td>Specified AMI ID does not exist.</td>
<td></td>
</tr>
<tr>
<td>InvalidAMIID.Unavailable</td>
<td>Specified AMI ID has been deregistered and is no longer available.</td>
<td></td>
</tr>
<tr>
<td>InvalidAssociationID.NotFound</td>
<td>Specified association ID does not exist.</td>
<td></td>
</tr>
<tr>
<td>InvalidAttachment.NotFound</td>
<td>The instance cannot detach from a volume to which it is not attached.</td>
<td></td>
</tr>
<tr>
<td>InvalidConversionTaskId</td>
<td>Specified conversion task ID (for instance or volume import) is invalid.</td>
<td></td>
</tr>
<tr>
<td>InvalidCustomerGateway.DuplicateIpAddress</td>
<td>Conflict among chosen gateway IP addresses.</td>
<td></td>
</tr>
<tr>
<td>InvalidCustomerGatewayID.NotFound</td>
<td>The specified customer gateway ID does not exist.</td>
<td></td>
</tr>
<tr>
<td>InvalidDevice.InUse</td>
<td>The device to which you are trying to attach (i.e. /dev/sdh) is already in use on the instance.</td>
<td></td>
</tr>
<tr>
<td>InvalidDhcpOptionsID.NotFound</td>
<td>Specified DHCP options ID does not exist.</td>
<td></td>
</tr>
<tr>
<td>InvalidFormat</td>
<td>Specified disk format (for instance or volume import) is invalid.</td>
<td></td>
</tr>
<tr>
<td>InvalidFilter</td>
<td>Specified filter is invalid.</td>
<td></td>
</tr>
<tr>
<td>InvalidGatewayID.NotFound</td>
<td>Specified gateway ID does not exist.</td>
<td></td>
</tr>
<tr>
<td>InvalidGroup.Duplicate</td>
<td>Attempt to create a duplicate group.</td>
<td></td>
</tr>
<tr>
<td>InvalidGroupId.Malformed</td>
<td>Specified group ID is invalid.</td>
<td></td>

</tr>
<tr>
<td>InvalidGroup.InUse</td>
<td>Specified group cannot be deleted because it is in use.</td>
<td></td>
</tr>
<tr>
<td>InvalidGroup.NotFound</td>
<td>Specified group name does not exist.</td>
<td></td>
</tr>
<tr>
<td>InvalidGroup.Reserved</td>
<td>Specified group name is a reserved name.</td>
<td></td>
</tr>
<tr>
<td>InvalidInstanceID.Malformed</td>
<td>Specified instance ID is not valid.</td>
<td></td>
</tr>
<tr>
<td>InvalidInstanceID.NotFound</td>
<td>Specified instance ID does not exist.</td>
<td></td>
</tr>
<tr>
<td>InvalidInternetGatewayID.NotFound</td>
<td>Specified Internet gateway ID does not exist.</td>
<td></td>
</tr>
<tr>
<td>InvalidIPAddress.InUse</td>
<td>Specified IP address is currently in use.</td>
<td></td>
</tr>
<tr>
<td>InvalidKeyPair.Duplicate</td>
<td>Attempt to create a duplicate key pair.</td>
<td></td>
</tr>
<tr>
<td>InvalidKeyPair.Format</td>
<td>Format of the public key you've attempted to import is invalid.</td>
<td></td>
</tr>
<tr>
<td>InvalidKeyPair.NotFound</td>
<td>Specified key pair name does not exist.</td>
<td></td>
</tr>
<tr>
<td>InvalidManifest</td>
<td>Specified AMI has an unparsable manifest.</td>
<td></td>
</tr>
<tr>
<td>InvalidNetworkAclEntry.NotFound</td>
<td>Specified network ACL entry does not exist.</td>
<td></td>
</tr>
<tr>
<td>InvalidNetworkAclID.NotFound</td>
<td>Specified network ACL ID does not exist.</td>
<td></td>
</tr>
<tr>
<td>InvalidParameterCombination</td>
<td>Example: RunInstances was called with both minCount and maxCount set to 0, or minCount &gt; maxCount.</td>
<td>Requests that could cause this error include (for example) supplying an invalid image attribute to the DescribeImageAttribute request or an invalid version or encoding value for the userData in a RunInstances request.</td>
</tr>
<tr>
<td>InvalidParameterValue</td>
<td>The value supplied for a parameter was invalid.</td>
<td>Requests that could cause this error include (for example) supplying an invalid image attribute to the DescribeImageAttribute request or an invalid version or encoding value for the userData in a RunInstances request.</td>
</tr>
<tr>
<td>InvalidPermission.Duplicate</td>
<td>Attempt to authorize a permission that has already been authorized.</td>
<td></td>
</tr>
<tr>
<td>Error Code</td>
<td>Description</td>
<td>Notes</td>
</tr>
<tr>
<td>------------</td>
<td>-------------</td>
<td>-------</td>
</tr>

<td>Specified permission is invalid.</td>
<td></td>
</tr>
<tr>
<td>InvalidReservationID.Malformed</td>
<td>Specified reservation ID is invalid.</td>
<td></td>
</tr>
<tr>
<td>InvalidReservationID.NotFound</td>
<td>Specified reservation ID does not exist.</td>
<td></td>
</tr>
<tr>
<td>InvalidRoute.NotFound</td>
<td>Specified route does not exist in the route table.</td>
<td></td>
</tr>
<tr>
<td>InvalidRouteTableID.NotFound</td>
<td>Specified route table ID does not exist.</td>
<td></td>
</tr>
<tr>
<td>InvalidSecurity.RequestHasExpired</td>
<td>The difference between the request timestamp and the AWS server time is greater than 5 minutes.</td>
<td>Ensure that your system clock is accurate and configured to use the correct time zone.</td>
</tr>
<tr>
<td>InvalidSnapshotID.Malformed</td>
<td>The snapshot ID that was passed as an argument was malformed.</td>
<td></td>
</tr>
<tr>
<td>InvalidSnapshot.NotFound</td>
<td>The specified snapshot does not exist.</td>
<td></td>
</tr>
<tr>
<td>InvalidUserID.Malformed</td>
<td>The user ID is neither in the form of an AWS account ID or one of the special values accepted by the owner or executableBy flags in the DescribeImages call.</td>
<td></td>
</tr>
<tr>
<td>InvalidReservedInstancesId</td>
<td>Reserved Instances ID not found.</td>
<td></td>
</tr>
<tr>
<td>InvalidReservedInstancesOfferingId</td>
<td>Reserved Instances Offering ID not found.</td>
<td></td>
</tr>
<tr>
<td>InvalidSubnetID.NotFound</td>
<td>Specified subnet ID does not exist.</td>
<td></td>
</tr>
<tr>
<td>InvalidVolumeID.Duplicate</td>
<td>Volume already exists in the system.</td>
<td></td>
</tr>
<tr>
<td>InvalidVolumeID.Malformed</td>
<td>Specified volume ID was malformed.</td>
<td></td>
</tr>
<tr>
<td>InvalidVolumeID.ZoneMismatch</td>
<td>Specified volume ID and instance ID are in different Availability Zones.</td>
<td></td>
</tr>
<tr>
<td>InvalidVolume.NotFound</td>
<td>Specified volume does not exist.</td>
<td></td>
</tr>
<tr>
<td>InvalidVpcID.NotFound</td>
<td>Specified VPC ID does not exist.</td>

## Request Error Response

The following shows the structure of a request error response.

```xml
<Response>
  <Errors>
    <Error>
      <Code>Error code text</Code>
      <Message>Error message</Message>
    </Error>
  </Errors>
  <RequestID>request ID</RequestID>
</Response>
```

## Example Error Response Request

The following shows an example of an error response.

```xml
<Response>
  <Errors>
    <Error>
      <Code>InvalidInstanceID.NotFound</Code>
      <Message>The instance ID 'i-4cbc822a' does not exist</Message>
    </Error>
  </Errors>
  <RequestID>ea966190-f9aa-478e-9ede-cb5432daacc0</RequestID>
</Response>
```

The following table describes the important changes since the last release of the Amazon EC2 documentation set.

**API version:** 2012-10-01.

**Latest documentation update:** September 11, 2012.

<table>
<thead>
<tr>
<th>Change</th>
<th>Description</th>
<th>Release Date</th>
</tr>
</thead>
</table>
| Support for Amazon EC2 Reserved Instance Marketplace and a New API Version | Added support for Amazon EC2 Reserved Instance Marketplace and a new API version: 2012-08-15. For information on the calls related to this release, see the following new commands:  
  - CancelReservedInstancesListing (p. 49)  
  - CreateReservedInstancesListing (p. 83)  
  - DescribeReservedInstancesListings (p. 252)  
  In addition, the following calls were updated:  
  - DescribeReservedInstancesOfferings (p. 256)  
  - PurchaseReservedInstancesOffering (p. 371) | 11 September 2012 |
<p>| Support for AWS Marketplace and a New API Version | Added support for AWS Marketplace AMIs and a new API version: 2012-04-01. | 19 April 2012 |</p>
<table>
<thead>
<tr>
<th>Change</th>
<th>Description</th>
<th>Release Date</th>
</tr>
</thead>
</table>
| Amazon EBS Volume Status Check | Starting with API version 2012-03-01, you can check the operational status of your Amazon EBS volume. The volume status check gives you information about the I/O, also known as read/write, capability of your EBS volumes. The volume status check lets you know when an EBS volume's data is potentially inconsistent. Amazon Web Services (AWS) gives you options to handle the potentially inconsistent volume. For information on the actions related to this release, see:  
  - DescribeVolumeStatus (p. 310)  
  - ModifyVolumeAttribute (p. 367)  
  - DescribeVolumeAttribute (p. 308)  
  - EnableVolumeIO (p. 342) | 12 March 2012 |
| Instance Status Checks | Starting with API version 2011-12-15, you can use the DescribeInstanceStatus action to retrieve results of automated checks performed by Amazon EC2. These status checks detect problems that may impair an instance's ability to run your applications. You can use ReportInstanceStatus to send us feedback or report an inaccurate instance status. | 30 December 2011 |
| Elastic Network Interfaces (ENIs) for Amazon EC2 Instances in Amazon Virtual Private Cloud | Starting with API version 2011-12-01, you can attach an elastic network interface (ENI) to an EC2 instance in a VPC. For more information, see:  
  - AttachNetworkInterface (p. 27)  
  - DetachNetworkInterface (p. 328)  
  - CreateNetworkInterface (p. 76)  
  - DeleteNetworkInterface (p. 131)  
  - DescribeNetworkInterfaces (p. 235)  
  - DescribeNetworkInterfaceAttribute (p. 233)  
  - ModifyNetworkInterfaceAttribute (p. 363)  
  - ResetNetworkInterfaceAttribute (p. 407) | 21 December 2011 |
<p>| New Offering Types for Amazon EC2 Reserved Instances | Starting with API version 2011-11-01, you can use the new offering-type parameter of DescribeReservedInstancesOfferings to identify the Reserved Instance offerings that address your projected use: Heavy Utilization, Medium Utilization, and Light Utilization. See DescribeReservedInstancesOfferings (p. 256). | 01 December 2011 |
| Support for Amazon EC2 Instance Status | The Request Parameters (p. 214) API action allows you to view the status of your instances and any upcoming scheduled events. | 14 November 2011 |
| Support for Amazon EC2 Spot Instances in Amazon VPC | The RequestSpotInstances (p. 394) action is updated with the subnet option, which enables you to specify an Amazon VPC subnet into which to launch your Spot Instances. | 11 October 2011 |</p>
<table>
<thead>
<tr>
<th>Change Description</th>
<th>Description</th>
<th>Release Date</th>
</tr>
</thead>
<tbody>
<tr>
<td>Support for VHD file format added to the 2011-07-15 API version</td>
<td>We've added VHD as one of the VM file formats supported for import into Amazon EC2. See the API actions ImportInstance and ImportVolume, and the CLI commands ec2-import-instance and ec2-import-volume.</td>
<td>24 August 2011</td>
</tr>
<tr>
<td>Updates for the 2011-07-15 API version</td>
<td>We've added one new data type, VpnTunnelTelemetryType (p. 535), for the 2011-07-15 API release.</td>
<td>03 August 2011</td>
</tr>
<tr>
<td>Temporary Security Credentials</td>
<td>We've added one new common request parameter, SecurityToken, that supports temporary security credentials. For more information, see Common Query Parameters (p. 536) or go to Using Temporary Security Credentials in the Amazon Elastic Compute Cloud User Guide.</td>
<td>03 August 2011</td>
</tr>
<tr>
<td>Spot Instances Availability Zone pricing changes</td>
<td>We've updated several actions that explain API changes for the Spot Instances Availability Zone pricing feature. We've also added new Availability Zone pricing options as part of the information returned by Spot Instance Requests and Spot Price History API calls.</td>
<td>26 May 2011</td>
</tr>
<tr>
<td>Updates for the 2011-05-15 API Version</td>
<td>We've updated several existing actions for the 2011-05-15 API release.</td>
<td>26 May 2011</td>
</tr>
<tr>
<td>Dedicated Instances</td>
<td>As part of the Dedicated Instances feature release, we've added new options related to the tenancy attribute of instances, and the instance tenancy attribute of VPCs.</td>
<td>27 March 2011</td>
</tr>
<tr>
<td>Updates for the 2011-02-28 API version</td>
<td>We've updated several existing actions for the 2011-02-28 API release.</td>
<td>27 March 2011</td>
</tr>
<tr>
<td>Updates for the 2011-01-01 API version</td>
<td>We've added new actions and updated several existing actions for the 2011-01-01 API release. The new and updated actions are related to these Amazon VPC objects: Internet gateways, route tables, network ACLs, VPC security groups, and VPC Elastic IP addresses.</td>
<td>11 March 2011</td>
</tr>
<tr>
<td>Merged Amazon VPC Documentation</td>
<td>We've merged the Amazon VPC actions into this guide.</td>
<td>11 March 2011</td>
</tr>
</tbody>
</table>
| VM Import | Added the following new actions, which allow you to import a virtual machine or volume into Amazon EC2:  
- ImportInstance (p. 348)  
- ImportVolume (p. 354)  
- DescribeConversionTasks (p. 172)  
- CancelConversionTask (p. 45) | 15 December 2010 |
<p>| Consolidated Documentation | We've consolidated the Query and SOAP API topics. See Actions (p. 9). | 06 December 2010 |</p>
<table>
<thead>
<tr>
<th>Change</th>
<th>Description</th>
<th>Release Date</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameters for ModifyImageAttribute and ModifyInstanceAttribute</td>
<td>Updated the list of Query parameters for ModifyImageAttribute (p. 357) and for ModifyInstanceAttribute (p. 360).</td>
<td>20 November 2010</td>
</tr>
<tr>
<td>Modifying Block Device Mapping</td>
<td>Removed information from ModifyInstanceAttribute (p. 360) about modifying an instance's block device mapping attribute. You currently can't modify an instance's block device mapping with this action.</td>
<td>20 November 2010</td>
</tr>
<tr>
<td>Filters and Tags</td>
<td>Added information about filters to many of the describe actions. Added information about creating, describing, and deleting tags. For more information about the API actions for tags, see CreateTags (p. 101), DeleteTags (p. 146), and DescribeTags (p. 298).</td>
<td>19 September 2010</td>
</tr>
<tr>
<td>Idempotent Instance Launch</td>
<td>Updated RunInstances to include a ClientToken parameter to ensure idempotency. For more information about the change to RunInstances, see RunInstances (p. 417).</td>
<td>19 September 2010</td>
</tr>
<tr>
<td>Import Key Pair</td>
<td>Added ImportKeyPair. For more information, see ImportKeyPair (p. 352).</td>
<td>19 September 2010</td>
</tr>
<tr>
<td>Placement Groups for Cluster Compute Instances</td>
<td>Added information about placement groups, which you use with cluster compute instances. For more information about the API actions for placement groups, see CreatePlacementGroup (p. 81), DescribePlacementGroups (p. 242), and DeletePlacementGroup (p. 133).</td>
<td>12 July 2010</td>
</tr>
<tr>
<td>Amazon VPC IP Address Designation</td>
<td>Amazon VPC users can now specify the IP address to assign an instance launched in a VPC. For information about using the PrivateIpAddress parameter with the RunInstances action, see RunInstances (p. 417).</td>
<td>12 July 2010</td>
</tr>
<tr>
<td>Error List Update</td>
<td>Updated the list of errors to include ClientBlocked, ClientInsufficientInstanceCapacity, ClientPendingVerification, and ClientUnsupported. For more information, see Error Codes (p. 538).</td>
<td>21 May 2010</td>
</tr>
<tr>
<td>Security Group Permissions</td>
<td>Clarified the information about authorizing security group permissions. For more information, see AuthorizeSecurityGroupIngress (p. 36).</td>
<td>28 April 2010</td>
</tr>
<tr>
<td>New Region</td>
<td>Amazon EC2 now supports the Asia Pacific (Singapore) Region. The new endpoint for requests to this Region is ec2.ap-southeast-1.amazonaws.com.</td>
<td>28 April 2010</td>
</tr>
<tr>
<td>Change</td>
<td>Description</td>
<td>Release Date</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>-------------------</td>
</tr>
<tr>
<td>Clarification about Spot Instances</td>
<td>Clarified that you can't stop and start Spot Instances that use an Amazon EBS root device. For more information about stopping instances, see StopInstances (p. 430).</td>
<td>1 February 2010</td>
</tr>
<tr>
<td>Spot Instances</td>
<td>To support customers that use Amazon EC2 instances, but have more flexible usage requirements (e.g., when instances run, how long they run, or whether usage completes within a specific timeframe), Amazon EC2 now provides Spot Instances. A Spot Instance is an instance that Amazon EC2 automatically runs for you when its maximum price is greater than the Spot Price. For conceptual information about Spot Instances, go to the Amazon Elastic Compute Cloud User Guide.</td>
<td>14 December 2009</td>
</tr>
